No.	Name	Synonyms	Formula	Mol Wt.
4028	**Formic acid**, isobutyl ester	isobutyl formate, β-methylpropyl methanoate*	$HCOOCH_2CH(CH_3)_2$	102 13
4029	——, isopropyl ester	isopropyl methanoate*	$HCOOCH(CH_3)_2$	88 10
4030	——, *l*-linalyl ester.	See *l-Linalool, formate.*		
4031	——, methyl ester	methyl methanoate*, methyl formate	$HCOOCH_3$	60 05
4032	——, octyl ester	*n*-octyl formate	$HCOO(CH_2)_7CH_3$	158 24
4033	——, *p*-phenylphenacyl ester		$HCOOCH_2COC_6H_4C_6H_5$	240 25
4034	——, propyl ester	*n*-propyl formate	$HCOOC_3H_7$	88 10
4035	——, **acetyl-.**	See *Pyruvic acid*		
4036	——, **o-aminobenzoyl-.**	See *Isatic acid.*		
4037	——, **benzoyl-.**	See *Glyoxylic acid, phenyl-*		
4038	——, **chloro-**, butyl ester	*n*-butyl chlorocarbonate	$ClCOO(CH_2)_3CH_3$	136 58
4039	——, ——, ethyl ester	ethyl chloromethanoate*, ethyl chlorocarbonate	$ClCOOC_2H_5$	108 53
4040	——, ——, isoamyl ester	γ-methylbutyl chloromethanoate*, isoamyl chlorocarbonate	$ClCOOC_5H_{11}$	150 61
4041	——, ——, isobutyl ester	β-methylpropyl chloromethanoate*; isobutyl chlorocarbonate	$ClCOOCH_2CH(CH_3)_2$	136 58
4042	——, ——, methyl ester	methyl chloromethanoate*, methyl chlorocarbonate	$ClCOOCH_3$	94 50
4043	——, ——, propyl ester	*n*-propyl chlorocarbonate	$ClCOOCH_2CH_2CH_3$	122 55
4044	——, ——, trichloromethyl ester.	See *Diphosgene.*		
4045	——, **cyano-**, ethyl ester	ethyl cyanomethanoate*; cyanoethyl carbonate	$CNCOOC_2H_5$	99 09
4046	——, **phenyl-.**	See *Benzoic acid.*		
4047	——, **2-thenoyl-.**	See *2-Thiopheneacetic acid, α-oxo-.*		
4048	**Formohydrazide**	formylhydrazine	$HCONHNH_2$	60 06
4049	**Formonitrolic acid**	methylnitrolic acid	$HC(:NOH)NO_2$	90 04
4050	**Formosa camphor.**	See *d-Camphor.*		
4051	**Formoxime.**	See *Formaldehyde, oxime.*		
4052	**Formyl chloride, chloro-.**	See *Phosgene.*		
4052M	**Formyl fluoride, fluoro-.**	See *Carbonyl fluoride.*		
4053	**Frangula emodin.**	See *Emodin.*		
4054	**Frangulin**	...	$C_{20}H_{20}O_9$	404 36
4055	**Fraxin**		$C_{16}H_{18}O_{10}$	370 31
4056	**D-Fructosamine**	isoglucosamine; isodextrosamine	$CH_2OH(CHOH)_3COCH_2NH_2$	179 17
4057	**D-Fructose**	levulose; fruit sugar	$C_6H_{12}O_6$	180 16
4058	**Fructosin.**	See *Levulin (synthetic).*		
4059	**Fruit sugar.**	See *D-Fructose.*		
4061	**Fucose**	2,3,4,5-tetrahydroxyhexanal* (one form)	$C_6H_{12}O_5$	164 16
4062	**Fulminic acid**, silver salt	silver fulminate; fulminating silver	$AgCNO$	149 90
4063	**Fulminuric acid**	2-cyano-2-nitroethanamide*; cyanonitroacetamide; isocyanuric acid	$CNCH(NO_2)CONH_2$	129 08

*Name approved by the International Union of Chemistry.

FORMULA INDEX OF ORGANIC COMPOUNDS

Numbers refer to compounds in the preceding table Physical Constants of Organic Compounds.

The arrangement of symbols in formulas is alphabetical except that C always comes first followed immediately by H if hydrogen is present. The arrangement of formulas is also alphabetical except that the number of atoms of any specific kind influences the order of compounds.

The numbers following any one formula are given in numerical order which is also their occurrence in the table of physical constants.

NOTE: the letter S preceding any compound number indicates that it is to be found in the **Supplement** to the table Physical Constants of Organic Compounds.

MELTING POINT INDEX OF ORGANIC COMPOUNDS

The following table lists the melting points of organic compounds in ascending order of temperature in degrees Centigrade. The compounds are identified by the numbers as given in the table Physical Constants of Organic Compounds.

The letter **S** preceding any compound number indicates that it is to be found in the **Supplement** to the table.

Melting points will be quoted as they occur in this table. The order of compounds listed with the same melting point is not significant and will be arbitrarily given in the order of the compound numbers. Owing to lack of agreement in values reported by various observers more than one value is sometimes given or the melting point is indicated by a temperature range. In such cases the position in the list is determined by the lower temperature of the stated range or by the *first* of two stated values, the second value being given in parentheses. Where the values are separated by more than 5° C the melting points are listed separately.

Melting points are given in bold face followed by the numbers of the compounds.

Abbreviations: **a** = anhydrous; h = **hydrate.**

BOILING POINT INDEX OF ORGANIC COMPOUNDS

The following table lists the boiling points of organic compounds in ascending order of temperature in degrees Centigrade. The compounds are identified by the numbers as given in the table Physical Constants of Organic Compounds.

The letter **S** preceding any compound number indicates that it is to be found in the **Supplement** to the table.

Boiling points will be quoted as they occur in this table. Only boiling points at or near atmospheric pressure will be listed. The order of compounds listed with the same boiling point is not significant and will be arbitrarily given in the order of the compound numbers. Owing to lack of agreement in values reported by various observers more than one value is sometimes given or the boiling point is indicated by a temperature range. In such cases the position in the list is determined by the lower temperature of the stated range or by the *first* of two stated values, the second value being given in parentheses. Where the values are separated by more than 5° C the boiling points are listed separately.

Boiling points are given in bold face followed by the numbers of the compounds.

PHYSICAL CONSTANTS OF INDUSTRIAL ORGANIC COMPOUNDS

The following table is intended to provide information concerning the characteristics and properties of commercially available organic compounds. The material presented has been compiled from information furnished by the manufacturers whose courtesy is gratefully acknowledged. Where the same compound has been reported by two or more manufacturers separate entries have been made.

ABBREVIATIONS

a	acid	g	grams	ppnt	precipitant
absorb	absorbent	gen	general	prep	preparatory, preparation
accel	accelerator	gran	granules, granular	press	pressure
acet	acetone	grn	green	pung	pungent
agt	agent	h	hot, high	purif	purification
al	alcohol	hyg	hygroscopic	pyr	pyridene
alk	alkali	i	insoluble	quant	quantities
amm	ammoniacal	imm	immiscible	redsh	reddish
approx	approximately	indust	industrial	rub	rubbing
art	artificial	init	initial	s	soluble
astring	astringent	inter	intermediate	*sec*	secondary
boil	boiling	lab	laboratory	sl	slight, slightly
br	brown	lacq	lacquer	sld	solid
bz	benzene	liq	liquid	soft	softener, softening
c	cold	lt	light	solv	solvent
ca	about	lubr	lubricating	suff	suffocating
cellu	cellulose	lust	lustrous	syn	synthesis
char	characteristic	m	most	synth	synthetic
chem	chemical	mat	material	tech	technical
cl	clear	meth	methyl	*tert*	tertiary
col	colorless	mfg	manufacture	tetr	tetragonal
com	common	min	minimum	thick	thickening
comp	compound, compartment	misc	miscible	trans	transparent
conc	concentrated	mix	mixture	trig	trigonal
cr	crystals	moist	moistening	typ	typical
d	decomposes	monocl	monoclinic	v	very
deliq	deliquescent	need	needles	veget	vegetable
deriv	derivative	nitro	nitrocellulose	visc	viscous
disp	dispersible	n res	non residual	vol	volume
dist	distilled	n vol	non volatile	w	water
dk	dark	org	organic	wh	white
et	ethyl	pa	pale	wt	weight
eth	ether	pen	penetrating	yel	yellow
ethylcellu	ethylcellulose	per	permanent	>	above
extr	extractant, extracting, extraction	pet	petroleum	<	below
f	finger	pharm	pharmaceutical	∞	soluble in all proportions
fa	faint	photo	photographic		
fl	flakes	pk	pink		
flam	flammable	pl	plates		
		pleas	pleasant		
		powd	powder

PHYSICAL CONSTANTS OF MINERALS

The following table presents data for about 350 of the more common minerals

In order to avoid duplication and save space, very few cross references are given in the body of the table. If the name sought is not found in the table, consult the **synonym index** given below.

Specific gravities are given at normal atmospheric temperatures, a more precise statement being valueless considering the large variations in natural minerals.

Hardness is given in terms of Moh's scale. (See under Hardness.)

Indices of refraction for the sodium line, λ = 5893 Å, unless otherwise indicated. Li, λ = 6708 Å. Indices will invariably be given in the order ω, ϵ or α, β, γ. Uniaxial crystals are considered positive if $\epsilon > \omega$, negative if $\omega > \epsilon$. Biaxial crystals are considered positive if β is nearer α in value than it is γ and negative if β is nearer γ than α.

4	Alabandite	manganblende	MnS	3.95–4.04
5	Albite	sodium feldspar	$Na_2O.Al_2O_3.6SiO_2$	2.61–2.64
6	Almandite	carbuncle, Al-Fe garnet	$Al_2O_3.3FeO.3SiO_2$	3.688–4.33
7	Aluminite	websterite	$Al_2O_3.SO_3.9H_2O$	1.66
8	Alunite	alum stone	$K_2Al_6(OH)_{12}(SO_4)_4$	2.58–2.75
9	Alunogenite	alunogen	$Al_2(SO_4)_3.18H_2O$	1.6–1.8
10	Amblygonite	hebronite	$AlPO_4.LiF$	2.98–3.15
11	Analcite	analcime	$Na_2O.Al_2O_3.4SiO_2.2H_2O$	2.22–2.29
12	Anatase	octahedrite	TiO_2	3.82–3.95
13	Andalusite		Al_2SiO_5 or $Al_2O_3.SiO_2$	3.1–3.2
14	Andesine	feldspar group	$(CaO,Na_2O)Al_2O_3.4SiO_2$	2.647–2.69
15	Andradite.	common garnet, black garnet	$3CaO.Fe_2O_3.3SiO_2$	3.64–3.9
16	Anglesite		$PbSO_4$	6.12–6.39
17	Anhydrite		$CaSO_4$	2.899–2.985
18	Anorthite	lime feldspar	$CaO.Al_2O_3.2SiO_2$	2.703–2.763
19	Anorthoclase	feldspar group, soda-microcline	$(Na,K)_2O.Al_2O_3.6SiO_2$	2.56–2.651
20	Anthophyllite		$(Mg,Fe)SiO_3$	2.857–3.2
21	Antigorite		$3MgO.2SiO_2.2H_2O$	2.55–2.62
22	Apatite	fluorapatite, asparagus-stone	$CaF_2.3Ca_3P_2O_8$	3.151–3.270
23	Apophyllite		$K_2O.8CaO.16SiO_2.16H_2O$	2.3–2.4
24	Aragonite		$CaCO_3$	2.85–2.94
25	Arcanite	aphthitalite, glaserite	$(K,Na)_2SO_4$	2.662
26	Argentite	silver glance	Ag_2S	7.24–7.40
27	Arsenic	native arsenic	As	5.64–5.78
28	Arsenopyrite	mispickel	$FeS_2.FeAs_2$	5.89–6.20
29	Atacamite		$3CuO.CuCl_2.3H_2O$	3.77–3.94
30	Augelite		$2Al_2O_3.P_2O_5.3H_2O$	2.77
31	Augite		$CaMg(SiO_3)_2 + (Mg,Fe)(AlFe)_2SiO_6$	3.2–3.6
32	Autunite	lime uranite	$CaO.2UO_3.P_2O_5.8H_2O.$	3.05–3.19
33	Axinite		$HCa_3Al_2BSi_4O_{16}$	3.22–3.314
34	Azurite	blue malachite, chessylite	$2CuCO_3.Cu(OH)_2$	3.77–3.83
35	Baddeleyite		ZrO_2	5.50–6.03
36	Barite	barytes	$BaSO_4$	4.3–4.6
37	Barysilite		$Pb_3Si_2O_7$	6.53–6.707
38	Bauxite	beauxite	$Al_2O_3.2H_2O$	2.55
39	Beccarite		$ZrO_2.SiO_2$	6.54–6.74
40	Benitoite		$BaTiSi_3O_9$	3.64–3.65
41	Bertrandite		$4BeO.2SiO_2.H_2O.$	2.571–2.60
42	Beryl.		$3BeO.Al_2O_3.6SiO_2$	2.63–2.91
43	Beryllonite.		$NaBePO_4$	2.845
44	Biotite	black mica	$(K,H)_2(Mg,Fe)_2(Al,Fe)_2(SiO_4)_3$	2.69–3.16

OF MINERALS

No.	Hardness	Crystalline form and color	Index of refract. (Na); n, ω, ϵ, α, β, γ	Angle of the optic axes, 2V °	′

No.	Name	Synonym	Formula	Sp. gr
1	Bismuth	native bismuth	Bi	9.70–9.83
2	Bloedite	blodite	$MgSO_4.Na_2SO_4.4H_2O$	2.22–2.28
3	Boracite	stassfurtite	$Mg_7Cl_2B_{16}O_{30}$	2.9–3.0
4	Borax	tincal	$Na_2B_4O_7.10H_2O$	1.69–1.72
5	Bornite	purple copper ore, erubescite	$FeS.2Cu_2S.CuS$	4.9–5.4
6	Bournonite	wheel ore	$PbCuSbS_3$	5.7–5.9
7	Brochantite		$CuSO_4.3Cu(OH)_2$	3.8–3.9
8	Bromyrite		$AgBr$	5.8–6.0
9	Brookite		TiO_2	3.87–4.084
10	Brucite		$MgO.H_2O$	2.38–2.4
11	Bunsenite		NiO	6.398
12	Cacoxenite		$FePO_4.Fe(OH)_3.4\frac{1}{2}H_2O$	3.38
13	Calamine See *hemimorphite, smithsonite*			
14	Calcite	calcspar, iceland spar	$CaCO_3$	2.711
15	Caledonite		$2(Pb,Cu)O.SO_3.H_2O$	6.4
16	Calomel	horn mercury	$HgCl$	6.482
17	Cancrinite		$4Na_2O.CaO.4Al_2O_3.2CO_2.9SiO_2.3H_2O$	2.42–2.50
18	Carnallite		$KCl.MgCl_2.6H_2O$	1.60
19	Carnotite		$K_2O.2UO_3.V_2O_5.3H_2O$	
20	Cassiterite	incl. tinstone, stream tin, wood tin	$SnSnO_4$	6.8–7.1
21	Celestite	celestine	$SrSO_4$	3.84–3.97
22	Cerargyrite	horn silver	$AgCl$	5.552
23	Cerussite	white lead ore	$PbCO_3$	6.46–6.57
24	Chabazite		$CaAl_2Si_6O_{16}.8H_2O$ (+Na,K)	2.08–2.16
25	Chalcanthite	blue vitriol, blue stone.	$CuSO_4.5H_2O$	2.12–2.30
26	Chalcedony	flint, agate	SiO_2	2.55–2.63
27	Chalcopyrite	copper pyrites	$CuFeS_2$	4.1–4.3
28	Chiolite		$5NaF.3AlF_3$	2.84–3.005
29	Chondrodite		$[Mg(F,OH)]_2Mg_3[SiO_4]_2$	3.10–3.22
30	Chromite		$FeO.Cr_2O_3$	4.32–4.57
31	Chrysoberyl	cymophane	$BeO.Al_2O_3$	3.50–3.84
32	Chrysocolla		$CuSiO_3.2H_2O$	2.40–2.42
33	Cinnabar	natural vermilion	HgS	8.0–8.2
34	Claudetite		As_2O_3	3.85–4.151
35	Cleveite (R)	A cryst. var. of uraninite		7.49
36	Clinochlorite	clinochlore	$H_8Mg_5Al_2Si_3O_{18}$	2.65–2.78
37	Cobaltite	cobalt glance	$CoAsS$	6.0–6.3
38	Colemanite		$Ca_2B_6O_{11}.5H_2O$	2.417–2.428
39	Columbite	niobite	$(Fe,Mn)(Cb,Ta)_2O_6$	5.26–7.30
40	Connellite		$CuSO_4.2CuCl_2.19Cu(OH)_2.H_2O$	3.4
41	Copiapite		$2Fe_2O_3.5SO_3.18H_2O$	2.1–2.2
42	Copper	native copper	Cu	8.8–8.9
43	Coquimbite		$Fe_2(SO_4)_3.9H_2O$	2.07–2.105
44	Cordierite	iolite, dichroite	$4(Mg,Fe)O.4Al_2O_3.10SiO_2.H_2O$	2.57–2.66
45	Corundum	ruby, sapphire	Al_2O_3	3.95–4.10

No.	Name	Synonym	Formula	Sp. gr.
1	Goslarite	zinc vitriol	$ZnSO_4.7H_2O$	1.9–2.1
2	Göthite		$Fe_2O_3.H_2O$	4.0–4.4
3	Graphite	plumbago, black lead	C (traces of Fe, SiO_2, etc.)	2.09–2.25
4	Grossularite	hessonite	$3CaO.Al_2O_3.3SiO_2$	3.4–3.6
5	Gummite (R)		$(Pb,Ca,Ba)SiU_3O_{12}.5H_2O(?)$	3.9–5.16
6	Gypsum		$CaSO_4.2H_2O$	2.314–2.328
7	Halite	rock salt	NaCl	2.135–2.170
8	Hambergite		Be_2HBO_4	2.347–2.36
9	Hanksite		$9Na_2SO_4\ 2Na_2CO_3.KCl$	2.562
10	Harmotome	harmotomite	$(K_2,Ba)O.Al_2O_3\ 5SiO_2.5H_2O$	2.345–2.50
11	Hausmannite		Mn_3O_4	4 722–4.856
12	Hauynite		$5(Na_2,Ca)O\ 3Al_2O_3.6SiO_2\ 2SO_3$	2.4–2.5
13	Helvite		$3(Be,Mn,Fe)_2SiO_4.(Mn,Fe)S$	3.16–3.37
14	Hematite		Fe_2O_3	4 9–5.3
15	Hemimorphite	calamine	$2ZnO\ SiO_2.H_2O$	3.45
16	Hercynite	iron spinel	$FeAl_2O_4$	3 91–3.95
17	Herderite		$CaPO_4\ BeFOH$	2.952–3 012
18	Heulandite		$CaO\ Al_2O_3\ 6SiO_2.5H_2O$	2 16–2.249
19	Hopeite		$3ZnO\ P_2O_5\ 4H_2O$	3.03
20	Hornblende	amphibole	$Ca(Mg,Fe)_3(SiO_3)_4,Al_2(Mg,Fe)_2(AlO_3)_2(SiO_3)_2,Fe(Mg,Fe)_2(FeO_3)_2(SiO_3)_2$	3.0–3.5
21	Hübnerite		$MnO.WO_3$	7 2–7.5
22	Hutchinsonite		$(Tl,Ag,Cu)_2S\ As_2S_3 + PbS.As_2S_3(?)$	4.6
23	Hydronephelite		$HNa_2Al_3Si_3O_{12}\ 3H_2O$	2 263–2 48
24	Hydrotalcite		$MgCO_3\ 5Mg(OH)_2.2Al(OH)_3\ 4H_2O$	2.04–2.091
25	Ilmenite	menaccanite, titanic iron ore	$FeO.TiO_2$	4 44–4.90
26	Iodyrite	iodargyrite	AgI	5 60–5 707
27	Jarosite		$K_2Fe_6(OH)_{12}.(SO_4)_4$.	3 15 3 26
28	Kainite		$MgSO_4\ KCl.3H_2O$	2 067–2.188
29	Kaliophilite	phacellite	$KAlSiO_4$	2 49–2 67
30	Kaolinite	china clay, kaolin	$Al_2O_3.2SiO_2.2H_2O$	2.60–2.63
31	Kieserite		$MgSO_4.H_2O$	2 57
32	Labradorite	Labrador feldspar, inter bet albite and anorthite	$NaAlSi_3O_8$, $CaAl_2Si_2O_8$, ratio 1:1 to 1:3	2 70 2.72
33	Lanarkite		$Pb_2O\ (SO_4)$	6 3–6.8
34	Lanthanite		$La_2(CO_3)_3.9H_2O$	2 6–2.74
35	Laubanite		$Ca_2Al_2Si_5O_{15}\ 6H_2O$	2 23
36	Laumontite	leonhardite, caporcianite	$CaO.Al_2O_3.4SiO_2.4H_2O$	2.23–2 42
37	Laurionite		$PbCl_2.Pb(OH)_2$	6.24
38	Lazulite		$(Fe,Mg)O.Al_2O_3.P_2O_5.H_2O$	3.057–3.122
39	Lazurite	lapis-lazuli	$3Na_2O_3\ 3Al_2O_3.6SiO_2.2Na_2S$	2.38–2.45
40	Leadhillite		$Pb(OH)_2\ PbSO_4.2PbCO_3$	6.26–6.44

COMPOSITION AND PHYSICAL PROPERTIES OF ALLOYS*

Composition	Name	Sp. gr.	Thermal expansion coefficient per °C.	Melting point °C.
Aluminum				
99.2Al	Aluminum 2S	2.71	23.94×10^{-6}	660
97Al, 3Cu	...	.	24	640
95Al, 5Cu	Lynite, body alloy		26	650
95Al, 4.2Cu, 0.6Mn, 0.5Si, 0.4Fe	Zeppelin rod	.	....	.
95Al, 2Cu, 1.5Mg, 0.8Fe, 0.2Si, 0.01Mn	Lynite, piston	...	...	.
94Al, 4Cu, 0.5Mg, 0.5Mn, coated with 99.7 + Al	Alclad 17 ST	2.96	21.96	538–46
93Al, 7-8.5Cu, ≯1.7 other elements	Lynite, 146			
92Al, 9.3–11Cu, ≯2 other elements	Lynite, 122			.
90Al, 7.8Cu, 1.5Zn, 1.3Fe	Lynite, crank case		.	
89Al, 11Cu, 0.5Mg	Lynite, piston	...		
89Al, 12–14Cu, ≯2 other elements	Lynite, 109	.....		
99Al, 0.4Fe, 0.4Si, 0.1Zn, 0.06Cu	Zeppelin braces	...		
90 Al, 10Mg	Magnalium	2.50	24	600
70Al, 30Mg	Magnalium	2.00		435
98Al, 1.25Mn	Aluminum Alloy 3S	2.74	23.04	640–55
95Al, 5Si	Aluminum-silicon 43	2.58	21.96	577–630
91Al, 9Zn		2.80	26	650
90Al, 7.8Zn, 0.7Cu, 0.5Fe, 0.4Si, 0.3Mn, 0.1Sn	Zeppelin angles	.	. .	
89Al, 9Zn, 0.7Cu, 0.5Si, 0.5Mn, 0.4Fe, 0.2Sn	Zeppelin channels			
77Al, 21Zn, 1.1Cu, 0.5Fe, Pb, Sn	Liberty pistons			
70Al, 30Zn	....	....	26	610
Bismuth				
53Bi, 32Pb, 15Sn	Eutectic fusible alloy			96
52Bi, 40Pb, 8Cd	Eutectic fusible alloy			91.5
50Bi, 27.1Pb, 22.9Sn	Rose metal			
50Bi, 27Pb, 13Sn, 10Cd	Eutectic fusible alloy, Lipowitz alloy			70–4
50Bi, 25Pb, 12.5Sn, 12.5Cd	Wood's metal	9.70		65.5
40Bi, 40Pb, 20Sn	Bismuth solder			111
54Bi, 26Sn, 20Cd	Eutectic fusible alloy			103
45Bi, 17Sn, 30Pb, 5–10Hg	Fusible tea spoons	...	.....	....
Cerium				
70–3Ce, 17–24Zn, 1.6–6Fe, 0–2.4Al, Mn	Ignition pin alloy			
61Ce, 37Fe	Ignition pin alloy	.	.	.....
Cobalt				
Co, Cr, W Alloy	Stellite No. 1 Alloy	8.59	14.4×10^{-6}	1250
Co, Cr, W Alloy	Stellite No. 6 Alloy	8.38	16.9×10^{-6}	1275
Co, Cr, W Alloy	Stellite No 12 Alloy	8.40	15.8×10^{-6}	1263
Co, Cr, W Alloy	Stellite Star J-Metal	8.76	14.6×10^{-6}	1270
Co, Cr, W Alloy	Stellite "2400" Alloy

COMPOSITION AND PHYSICAL PROPERTIES OF ALLOYS (Continued)

Composition	Name	Sp. gr.	Thermal expansion coefficient per °C.	Melting point °C.
Copper				
90Cu, 10Zn	Commercial bronze; red brass	8.80	18.18×10^{-6}	1050
89Cu, 9Zn, 2Pb	Hardware bronze	8.83	18.18	1050
85Cu, 15Zn	Red brass	8.75	18.72	1030
85Cu, 13Zn, 2Sn	Pen metal			
84Cu, 16Zn	Medal metal			
70Cu, 29Ni, 1Sn	Adnic		16.29	1205
70Cu, 29Zn, 1Sn	Admiralty	8.17	20.16	935
67-72Cu, 28-33Zn, Pb, Fe	Spring brass			
67-70Cu, 30-33Zn, Pb, Fe	Cartridge brass			
67Cu, 33Zn	Brass, ordinary yellow	8.40	18.5	940
64Cu, 25Zn, 8.5Pb, 2.5Sn	Ship nail brass			
61.2Cu, 37.3Zn, 0.9Sn, 0.4Pb, 0.2Fe				
61Cu, 39Zn	Pin wire brass			905
60-1Cu, 31-7Zn, 1.4Sn, 0.7-.9Pb	Pewter, for clock work			
60Cu, 40Zn	Muntz metal			840
60Cu, 25Zn, 15Ni	German silver		18.4	
60Cu, 19Zn, 10Al, 6Fe, 5Mn	Hytensl bronze			980
58Cu, 42Zn	Solder, very refractory			850
58Cu, 17.5Zn, 11.5Ni, 11Co, 2Ag	Chinese silver			
57Cu, 28Zn, 15Sn	Solder, very soft, white			
55Cu, 45Zn	For brazing			880
55Cu, 25Zn, 20Ni	German silver, common formula			
53Cu, 43Zn, 1.3Sn, 0.3Pb	Solder, hard yellow			
53Cu, 39Zn, 2.7Sn, 2.5Ni, 1.7Mn, 0.2Al	Manganin			
52Cu, 26Zn, 22Ni	German silver	8.45		
51Cu, 32Zn, 9.5Pb, 6.4Ni, 1.6Sn	Dienett's German silver			
50Cu, 50Zn	Solder, refractory			900
50-7Cu, 43-50Zn	Solder, hard			
50-62Cu, 20-32Zn, 12-30Ni	German silver, Birmingham			
50-60Cu, 20-5Zn, 20-5Ni	German silver, Austrian (Gersdorf)			
46Cu, 34Zn, 20Ni	German silver, best			
Gold				
79Au, 21Al	Roberts-Austen (purple gold)			750
92Au, 8Cu	Standard gold, Great Britain			900
90Au, 10Cu	Coinage	17.17		940
84Au, 16Cu	Jewelry			895
75Au, 24Cu	Jewelry			925
67Au, 25Cu, 8Ag	Pen metal			
67Au, 8-27Cu, 6.6-26Ag	Gold 16 carat			
62Au, 13Cu, 11Ag	Gold 15 carat			
58Au, 14-28Cu, 4-28Ag	Gold 14 carat			
50Au, 50Cu	Dark red gold			1000
50Au, 35Cu, 15Ag	Gold solder 12 carat

94.76–93.86Fe, .10–.20C, .30–.60Mn, 4.75–5.25Ni, .040P, .050S	Steel, S.A.E. No. 2515	
93.85–92.18Fe, .20–.37C, 1.10–1.40Al, 1.00–1.30Cr, .40–.70Mn, .20–.30Mo, 3.25–3.75Ni	Nitriding Steels, N125N	
81.20–77.00Fe, .50–.70C, 3.00–4.00Cr, .30Mn, 15.00–18.00W	Steel, S.A.E. No. 71660	
80.5–65Fe, 4.5–5C, 15–30Mn	Spiegeleisen	1065–1225
73.91–68.49Fe, .08C, 17.00–20.00Cr, .20–.70Mn, .75Mo, 8.00–10.00Ni, .030P, .030S	Steel, S.A.E. No. 30905	
71.11–65.61Fe, 0.08C, 17.5–20Cr, 1.25Mn, 8–10Ni, 2–3Si, .03P, .03S	Enduro 18–8–B	
67.9Fe, .10C, 17Cr, 3.0Mo, 12Ni	Stainless 316	
63.55–39.5Fe, 0.2–3.5C, 35–45V	Ferrovanadium	1425–1475
56.75–52.75Fe, 0.25C, 24–26Cr, 19–21Ni	Stainless 310	
Magnesium		
98.5Mg, 1.5Mn	Wrought Magnesium Alloys No. AM3S	
95.8Mg, 3Al, 1Zn, 0.2Mn	Wrought Magnesium Alloys No. AM52S	
93.7Mg, 2.5Al, 0.3Mn, 3.5Cd	Dowmetal L	
93.1Mg, 6.5Al, 0.2Mn, 0.2Si	Dowmetal EX	
91.6Mg, 7Al, 1.2Zn, 0.2Mn	Wrought Magnesium Alloys No. AM-C57S	
91Mg, 3.5Al, 0.5Mn, 5Sn	Wrought Magnesium Alloys No. AM65S	
90.8Mg, 8.5Al, 0.5Zn, 0.2Mn	Wrought Magnesium Alloys No. AM-C58S	

COMPOSITION AND PHYSICAL PROPERTIES OF ALLOYS (CONTINUED)

Composition	Name	Melting point °C.
Magnesium		
90.8Mg, 6Al, 3Zn, 0.2Mn	Casting Magnesium Alloys No. AM265	
89.8Mg, 10Al, 0.2Mn	Casting Magnesium Alloys No. AM240.	
89.4Mg, 10Al, 0.1Mn, 0.5Si	Dowmetal K	
89.3Mg, 10Al, 0.2Mn, 0.5Si	Casting Magnesium Alloys No. AM230	
88.8Mg, 9Al, 2Zn, 0.2Mn	Casting Magnesium Alloys No. AM260	
Manganese		
80–85Mn, 0.3–1.0C, 19.7–14Fe	Low carbon ferromanganese	
78–82Mn, 6–8C, 16–10Fe	Standard ferromanganese	1255
Molybdenum		
55–65Mo, 45–35Fe	Ferromolybdenum	1625
Silicon		
74–79Si, 26–21Fe	75% Ferrosilicon	1175
Tungsten		
78–83W, 1.0C, 21–16Fe	Ferrotungsten	1800–1900

PROPERTIES OF COMMERCIAL PLASTICS

Compiled by Lauchlin M. Currie—1943

Trade Names of Plastics

Trade Names	Type	Composition	No.	Made By
Alvar	T.P.	Polyvinyl acetal	11	S
Ameroid	T.P.	Casein	2	A
Bakelite	T.S.	Phenol Formaldehyde	7, 9	B
Bakelite	T.S.	Urea Formaldehyde	17	B
Bakelite	T.P.	Cellulose acetate	3	B
Bakelite	T.P.	Polystyrene	14	B
Beetle	T.S.	Urea Formaldehyde	17	Be
Butacite	T.P.	Polyvinyl Acetal	11	Du
Catalin	T.S.	Phenol Formaldehyde	7, 9	Ca
Catalin	T.S.	Melamine Formaldehyde	18	Ca
Celluloid	T.P.	Cellulose Nitrate	3	Ce
Crystalite	T.P.	Acrylate and Methacrylate Resin	1	Rh
Durez	T.S.	Phenol Formaldehyde	7	Dz
Durite	T.S.	Phenol Formaldehyde	7	Dr
Durite	T.S.	Phenolic Furfural	10	Dr.
Ethocel	T.P.	Ethylcellulose	6	D, H
Ethofoil	T.P.	Ethylcellulose	6	D
Fibestos	T.P.	Cellulose Acetate	3	Mo
Formica	T.S.	Phenol Formaldehyde (Lamination)	8	F
Formvar	T.P.	Polyvinyl Formal	11	S
Gelva	T.P.	Polyvinyl acetate	12	S
Haveg	T.S.	Phenol Formaldehyde (Lamination)	8	Ha
Indur	T.S.	Phenol Formaldehyde	7	R
Koroseal	T.P.	Modified Polyvinyl Chloride	13A	Gr
Loalin	T.P.	Polystyrene	14	Ca
Lucite	T.P.	Methyl Methacrylate Resin	1	Du
Lumarith	T.P.	Cellulose Acetate	3	Ce
Lustron	T.P.	Polystyrene	14	Mo
Makalot	T.S.	Phenol Formaldehyde	7	M
Marblette	T.S.	Phenol Formaldehyde	9	Ma
Melmac	T S.	Melamine Formaldehyde	18	Be
Micarta	T.S.	Phenol Formaldehyde (Lamination)	8	W
Nitron	T.P.	Cellulose Nitrate	5	Mo
Nixonoid	T.P.	Cellulose Nitrate	5	N
Nixonite	T.P.	Cellulose Acetate	3	N
Opalon	T.S.	Phenol Formaldehyde (cast)	9	Mo
Parlon	T.P.	Rubber Derivative	16	H
Plaskon	T.S.	Urea Formaldehyde	17	P
Plaskon	T.S.	Melamine Formaldehyde	18	P
Plastacele	T.P.	Cellulose Acetate	3	Du
Plexiglas	T.P.	Acrylate and Methacrylate Resin	1	Rh
Plioform	T.P.	Rubber Derivative	15	Gy
Pliolite	T.P.	Rubber Derivative	15	Gy
Prystal	T.S.	Phenol Formaldehyde (cast)	9	Ca
Protectoid	T.P.	Cellulose Acetate	3	Ce
Pyralin	T.P.	Cellulose Nitrate	5	Du
Resinox	T.S.	Phenol Formaldehyde	7	Mo
Saflex	T.P., T.S.	Polyvinyl Butyrals	11	Mo
Saflex F	T P.	Polyvinyl Formals	11	Mo
Saran	T.P.	Vinylidene Chloride	19	D
Styron	T.P.	Polystyrene	14	D
Tenite	T P	Cellulose Acetate	3	T
Tenite II	T.P.	Cellulose Acetate Butyrate	4	T
Textolite	T.S	Phenol Formaldehyde	7, 8	Ge
Tornesit	T P	Rubber Derivative	16	H
Vinylite A	T.P.	Polyvinyl Acetate	12	C
Vinylite Q	T P.	Polyvinyl Chloride	13A	C
Vinylite V	T.P.	Vinyl chloride-acetate copolymer	13 13A	C
Vinylite X	T.P.	Polyvinyl Butyral	11	C

PROPERTIES OF COMMERCIAL PLASTICS (Continued)

Manufacturers of Plastics

Code Designation	Manufacturer	Producers of
A	American Plastics Corp. 50 Union Square, New York City	2
B	Bakelite Corporation 30 E. 42 Street, New York City	3, 7, 9, 14, 17
Be	Beetle Products Division American Cyanamid Company 30 Rockefeller Plaza, N.Y.C.	17, 18
C	Carbide and Carbon Chemicals Corp. 30 East 42 St., New York City	11, 12, 13, 13A
Ca	Catalin Corporation No. 1 Park Ave., New York City	7, 9, 14, 18
Ce	Celluloid Corporation 10 E. 40th Street, New York City	3, 5
D	Dow Chemical Company Midland, Michigan	6, 14, 19
Du	E. I. duPont de Nemours and Co. Plastics Department 10th and Market Street Wilmington, Del.	1, 3, 5, 11
Dz	Durez Plastics and Chemicals, Inc. North Tonawanda, N. Y.	7
Dr	Durite Plastics 5010 Summerdale Ave. Philadelphia, Pa	7, 10
F	Formica Insulation Company 4671 Spring Grove Avenue Cincinnati, Ohio	8
Ge	General Electric Co., Plastic Dept No. 1 Plastics Ave., Pittsfield, Mass.	7, 8
Gr	B. F. Goodrich Company Akron, Ohio	13A
Gy	Goodyear Tire and Rubber Co., Inc. Akron, Ohio	15
Ha	Haveg Corporation East Newark, Delaware	8
H	Hercules Powder Co. 999 Market Street Wilmington, Del.	3, 6, 16
M	Makalot Corporation 262 Washington Street Boston, Mass.	7
Ma	Marblette Corporation 37-21 30th Street Long Island City, N.Y.	9
Mo	Monsanto Chemical Co. Plastics Division Springfield, Mass.	3, 5, 7, 11
N	Nixon Nitration Works Nixon, N. J.	3, 5
P	Plaskon Company, Inc. 2121 Sylvan Ave., Toledo, Ohio	17, 18
R	Reilly Tar and Chem. Corporation 500 Fifth Ave., New York City	7
Rh	Rohm and Haas Co., Inc. 222 W. Washington Square Philadelphia, Pa.	1
Sc	Shawinigan Chemicals, Ltd P. O. Box 6072, Montreal, Canada	11, 12

2 In general for all plastics, dielectric strength is a function of the thickness For polystyrene in particular· Instantaneous Dielectric Strength—0 005 in thick - 3500v/mil, 0 015 in thick = 2200 v/mil; 0 125 in thick = 500-700 v/mil Complete information concerning thicknesses tested is not available for other plastics

PHYSICAL PROPERTIES OF NATURAL AND SYNTHETIC RUBBER STOCKS

Compiled by I. B. Prettyman

This table was compiled, for the most part, from the literature. Every effort has been made to give values for stocks of comparable formulation and vulcanization for any one property. It was manifestly impossible to do so between properties. Furthermore, the polymers themselves varied in the proportions of base materials and in the methods of preparation, often in an undisclosed manner. Finally, it is to be realized that changes are constantly being made, both in the polymers and in the stock formulations, and that often variations may be effected for the purpose of enhancing one or more of the specific properties, as desired.

Type of polymer	Natural rubber (Hevea)	Butadiene-styrene copolymer	Butadiene-acrylonitrile copolymer	Polychloroprene (neoprene)	Isobutylene-diolefin copolymer (butyl)	Alkylene polysulfide
RAW POLYMER						
Specific gravity, 25°C	0.92	0.94	1.00	1.25	0.91	1.35
Heat capacity, 25°C (Int. joules × gm^{-1} × $°C^{-1}$)	1.88	1.97	1.97	....	....	....
VULCANIZED PURE GUM TYPE COMPOUND						
D.-C. resistivity, 25°C (ohm × cm)	10^{17}	10^{15}	10^{10}	10^{11}	10^{17}	10^{13}
Dielectric constant, 1 kc/sec., 25°C	2.7	2.9	13	9	2.4	6
Power factor, 1 kc/sec., 25°C (%)	0.23	0.32	5.5	3	0.30	
Permeability to gas (cc at NTP/cm^2/cm thickness/sec/cm Hg)						
Hydrogen	47×10^{-10}	11×10^{-10}	20×10^{-10}	12×10^{-10}	....	4×10^{-10}
Air	11×10^{-10}	....	....	....	1×10^{-10}	....
VULCANIZED CARBON BLACK TYPE COMPOUND						
Tensile strength based on original section, 25°C (kg × cm^{-2})	315	230	280	245	210	110
Elongation at break, 25°C (%)	600	580	580	580	640	600
Stress at 300% elongation based on original section, 25°C (kg × cm^{-2})	120	120	135	125	55	70

PHYSICAL PROPERTIES OF NATURAL AND SYNTHETIC RUBBER STOCKS (Continued)

Type of polymer	Natural rubber (Hevea)	Butadiene-styrene copolymer	Butadiene-acrylonitrile copolymer	Polychloroprene (neoprene)	Isobutylene-*diolefin* copolymer (butyl)	Alkylene *polysulfide*
Static shear modulus (shear strain in 0.01 to 0.05 range) (megadynes $\times$ cm^{-2})						
30°C	18	25	15	14	18	....
100°C	13	10	10	11	9	....
Dynamic shear modulus at 60 cycles/sec (shear strain in 0.05 to 0.15 range)(megadynes $\times$ cm^{-2})						
30°C	24	54	27	27	35	....
100°C	14	17	13	18	13	....
Hysteresis index (frequency $\times$ internal friction) measured in shear at 60 cycles/sec (shear strain in 0.05 to 0.15 range)(megagm $\times$ cm^{-1} $\times$ sec^{-2})						
30°C	3.0	8.8	5.1	5.0	4.6	....
100°C	1.1	3.0	1.5	2.0	2.0	....
Ball rebound (1.9 cm steel ball dropped 100 cm on sample 1.9 cm thick) (%)						
−20°C	12	13	13	8	15	....
20°C	45	37	33	35	9	....
100°C	71	47	63	67	50	....
Compression set (A.S.T.M. method B, 30% constant deflection 22 hr. at 70°C) (%)	35	42	27	49	38	80
Stress relaxation (time for 0.076 cm thick sample to relax to 60% of 10 sec. stress value, 50% elong., 100°C) (hr)	3.7	14	16	1.5	5	....
Tear resistance (Crescent test) (kg $\times$ cm^{-1})	125	55	50	75	75	50
Weather exposure cracking (elongated) (rating)	4	5	3	0	0	0

PHYSICAL PROPERTIES OF NATURAL AND SYNTHETIC RUBBER STOCKS (Continued)

Type of polymer	Natural rubber (Hevea)	Butadiene-styrene copolymer	Butadiene-acrylonitrile copolymer	Polychloroprene (neoprene)	Isobutylene-diolefin copolymer (butyl)	Alkylene polysulfide
Swelling in solvents, volume in 7 days (%)						
Gasoline 25°C	150	100	15	20	300	1
Benzene 25°C	190	210	160	150	150	90
Mineral oil 70°C	130	70	1	10	200	0
Water 70°C	3	2	3	3	....	12
Cold stiffening index (temp. to reach bending modulus of 700 kg × cm^{-2}, 20 min. exposure) (°C)	−47*	−40	−30	−37*	−40	−40*
Cold brittle point (Bell Lab. impact type test) (°C)	−54	−60	−38	−40	−40	−37
Volume compressibility (pressure of 300 kg × cm^{-2}) (bar^{-1})	37×10^{-6}	36×10^{-6}	33×10^{-6}	31×10^{-6}	....	....
Thermal diffusivity (25°C to 100°C) ($cm^2 \times sec^{-1}$)	.0010	.0012	.0012	.0012	....	....
Thermal conductivity (25°C to 100°C) ($cal \times sec^{-1} \times cm^{-1} \times °C^{-1}$)	.00039	.00046	.00049	.00046	....	....

* Modulus of 700 kg × cm^{-2} may be reached at higher temperatures upon extended exposure.

PHYSICAL PROPERTIES OF PIGMENTS

Rutherford J. Gettens

Trial Data on Painting Materials—Pigments and Inert Materials
Technical Studies, **VIII**, 1939

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Aluminum hydrate, $Al(OH)_3$	2 45	v. fine amorph part.	n_Σ *c* 1.50–1.56 [M*]
Aluminum stearate, $Al(C_{18}H_{35}O_2)_3$	0 99	agg. of spher. gr.	1.49 (w. bi.) [W]
Anhydrite, $CaSO_4$	2.93	cryst. frag.	α1.570, γ1.614, β1.575 [LB]
Antimony oxide, Sb_2O_3	5 75	v. fine cryst.	{ valentinite, α2.18, γ and β 2.35 / senarmonite, 2 09 (isot.) } [LB,M*]
Antimony vermilion, Sb_2S_3	..	v. fine red glob.	n_{Li} 2.65 (isot.) [M*]
Asphaltum (bitumen), carbonaceous	.	irr. amorph. part.	1.64–1.66 [M*]
Azurite, $2CuCO_3.Cu(OH)_2$	3 80	cryst frag.	α1.730, γ1.838, β1.758 [LB]
Barytes (barite, nat.) $BaSO_4$	4 45	cryst. frag.	α1.636, γ1.648, β1.637 [LB]
(blanc fixe, art.), $BaSO_4$	4 36	v. fine cryst. agg.	1.62–1.64 [M*]
Barium yellow, $BaCrO_4$	4 49	v. fine cryst. gr.	1.94–1.98 (bi.) [M]
Blue verditer, $2CuCO_3.Cu(OH)_2$		fibrous agg.	α_Σ1.72, γ_Σ slightly > 1.74 [M*]
Bone black C + $Ca_3(PO_4)_2$	2 29	irr. coarse lumps	1.65–1.70 (for larger translucent gr) [M]
Cadmium red, CdS (Se)	4 5	min. round. gr.	2.64 (bright red)–2.77 (deep red) (isot.) [M*]
Cadmium red lithophone, CdS(Se) + $BaSO_4$	4 30	min. round. gr.	2.50–2.76 (for CdS (Se) part) (isot.) [M*]
Cadmium yellow, CdS	4 35	min. round. gr.	2.35–2.48 (isot.) [M*]
Cadmium yellow lithophone, CdS + $BaSO_4$	4 25	fine comp. gr.	2.39–2.40 (for CdS part) [M*]
Cerulean blue, $CoO.nSnO_2$		round. gr.	1.84 (isot.) [M*]
Chalk (whiting), $CaCO_3$	2 70	hollow spherulites	ϵ_Σ *c* 1.510, ω_Σ *c* 1.645 [M*]
Charcoal black, C		irr splintery part	(opaque)
China clay (kaolinite), $Al_2O_3.2SiO_2.2H_2O$	2 60	fine, vermicular cryst	α1.558, γ1 565, β1.564 (all ± .005) [LB,M*]
Chrome green (med.) $Fe_4[Fe(CN)_6]_3$ + $PbCrO_4$	4 06	fine green agg.	*c* 2.4 (cf. Prussian blue and chrome yellow) [M*]
Chrome red, $PbCrO_4.Pb(OH)_2$	6 7	tabular cryst.	α2.42, γ2 7+, β2 7 [M]
Chrome yellow (med.) $PbCrO_4$	5.96	fine prism. gr.	$\alpha_{620m\mu}$ < 2.31, $\gamma_{650m\mu}$ 2.49 [M]
Chromium oxide green, opaque, Cr_2O_3	5.10	fine cryst. agg.	n_{Li} 2.5 [M]
Chrysocolla, $CuSiO_3.nH_2O$	2 4	crypt. agg.	α1.575, γ1.598, β1.597 [LB]

PHYSICAL PROPERTIES OF PIGMENTS (Continued)

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Cobalt blue, $CoO.Al_2O_3$	3.83	round. gr.	n var.; max. c 1.74$_{blue}$ (isot.) [M]
Cobalt green, $CoO.nZnO$	.	spher. gr.	1.94–2.0 (w. bi.) [M*]
Cobalt violet, $Co_3(PO_4)_2$		round. gr.	ϵ1.65–1.79 (dull violet), ω1.68–1.81 (salmon) (s. bi.) [M]
Cobalt yellow, $CoK_3(NO_2)_6.H_2O$	....	fine dendritic cryst.	1.72–1.76 (isot.) [W]
Diatomaceous earth, SiO_2	2.31	min. fossil forms	n mostly 1.435, some 1.40 [M*]
Egyptian blue, $CaO.CuO.4SiO_2$	....	cryst. frag.	ϵ1.605, ω1.635 [APL]
Emerald green, $Cu(C_2H_3O_2)_2.3Cu(AsO_2)_2$	3.27	spherulites and disks	α_Σ1.71, γ_Σ1.78 (w. pleo.) [M*]
Gamboge, organic resin	....	irr. amorph. part.	1.582–1.586 [W]
Graphite, C	2.36	irr. plates	(opaque) [M]
Green earth (celadonite and glauconite), Fe, Mg, Al, K, hydrosilicate	2.5–2.7	round. irr. gr.	n var. c 1.62 (porous) [M*]
Gypsum, $CaSO_4.2H_2O$	2.36	fine cryst. gr.	α1.520, γ1.530, β1.523 [LB]
Indian yellow, $C_{19}H_{16}O_{11}Mg.5H_2O$	.	prisms, plates	1.67 (w. bi.) [M*]
Iron oxide red (haematite), Fe_2O_3	5.2	min. cryst.	ϵ_{Li} 2.78, ω_{Li} 3.01 [M]
Lamp black, C	1.77	min. round. part.	(opaque)
Lithopone (regular), ZnS (28–30%), $BaSO_4$ (72–70%)	4.30	fine comp. gr.	2.3 (ZnS)–1.64 ($BaSO_4$) [M]
Malachite, $CuCO_3.Cu(OH)_2$	4.0	cryst. frag.	α1.655, γ1.909, β1.875 [LB]
Manganese blue, $BaMnO_4 + BaSO_4$	.	gr. and stubby prisms	c 1.65 [W]
Manganese violet, $(NH_4)_2Mn_2(P_2O_7)_2$	.	fine cryst. gr.	α1.67, γ1.75, β1.72, (for violet) [M]
Massicot (litharge), PbO	9.40	min. flakes	α_{Li} 2.51, γ_{Li} 2.71, β_{Li} 2.61 [M]
Mayan blue, Fe, Mg, Ca, Al, silicate (?)	..	porous irr. agg.	β_Σ1.54 (irr.; bi. and pleo.) [M*]
Mica (muscovite), $H_2KAl_3(SiO_4)_3$	2.89	platy frag.	α1.563, γ1.604, β1.599 [LB]
Molybdate orange, Pb(Mo, S, Cr, P)O_4	...	min. round. gr.	β_{Li} 2.55 (s. bi.) [M*]
Naples yellow, $Pb_3(SbO_4)_2$	....	round. gr.	2.01–2.28 (isot.) [M*]
Ochre, yellow (goethite), $Fe_2O_3.H_2O$, clay, etc.	2.9–4.0	irr. spherulites	n_Σ2.0 (isot. part); $(\alpha\beta)_\Sigma$2.05–2.31, γ_Σ2.08–2.40 (bi. part) [M*]
Orpiment, As_2S_3	3.4	min. flakes	α_{Li} 2.4 ±, γ_{Li} 3.02, β_{Li} 2.81 [LB]
Prussian blue, $Fe_4[Fe(CN)_6]_3$	1.83	colloidal agg.	1.56$_{460m\mu}$ [M*]
Pumice (volcanic glass), Na, K, Al, silicate		vesicular vitr. frag.	c 1.50 (isot.) [M*]

PHYSICAL PROPERTIES OF PIGMENTS (Continued)

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Realgar, As_2S_2	3 56	cryst. frag.	α_L, 2.46 γ_L, 2.61 β_L, 2.59 [LB]
Red lead, Pb_3O_4 (c 95%)	8 73	crypt. agg.	2.42_L, (w. bi.; pleo.) [M]
Sepia, organic		angular frag.	(opaque) [M*]
Sienna, burnt, Fe_2O_3, clay, etc.	3 56	uneven, round. part.	c 1.85 (var.) (isot.) [M]
Sienna, raw (goethite), $Fe_2O_3.H_2O$, clay, etc.	3 14	uneven sperulites	1.87–2.17 (mostly 2.06) (isot) [M*]
Silica (quartz), SiO_2	2 66	cryst. frag.	ϵ1.553, ω1.544 [LB]
(chalcedony), SiO_2	2 6	crypt. agg.	ϵ, ω 1.54 [LB, M*]
Smalt, K, Co(Al), silicate (glass)		splintery vitr. frag.	1.49–1.52 [M*]
Strontium yellow, $SrCrO_4$		small needles	α, β (or ω) 1.92, γ (or ϵ) 2,01 (‖ ext.) [M*]
Talc, $3MgO.4SiO_2.H_2O$	2 77	platy frag.	α1.539, γ1.589, β1.589 [LB]
Titanium barium white, TiO_2 (25%) + $BaSO_4$ (75%)	4 30	min. round. gr.	$n_\Sigma c$ 1.7–2 5 [M*]
Titanium calcium white, TiO_2 (25%) + $CaSO_4$ (75%)	3 10	prism. or ragged gr.	mostly 1.8–2.0 (irr.) (bi.) [M*]
Titanium dioxide (anatase), TiO_2	3 9	min. round. gr.	ϵ and ω2.5 (w. bi) [M*]
(rutile), TiO_2	4 2	round, or prism. gr.	ϵ2.9, ω2.6 [M*]
Ultramarine blue (art.), $Na_{8-10}Al_6Si_6O_{24}S_{2-4}$	2 34	uniform small round. gr	n 1.51_{green}, 1.63_{red} (isot.) [M]
(nat., lazurite), $3Na_2O.3Al_2O_3.6SiO_2.2Na_2S$	2 4	angular, broken frag.	1.50 ± (isot.) [LB]
Ultramarine violet		round, gr, (blue, rose, and violet)	c 1.56 (isot.) [M*]
Umber, burnt, Fe_2O_3 + MnO_2, clay, etc.	3 64	uneven, round. gr.	mostly 2.2–2.3 [M*]
Umber, raw, Fe_2O_3 + MnO_2 + H_2O, clay, etc.	3 20	uneven, round. gr.	mostly 1.87–2.17 [M*]
Van Dyke brown, bituminous earth	1 66	irr. amorph. part.	1.62–1.69 [M*]
Verdigris (copper basic acetate) $Cu(C_2H_3O_2)_2$.-$2Cu(OH)_2$		cryst. frag.	α1.53, γ1.56 [M]
Vermilion (art.), HgS	8 09	hexagonal gr. and pr.	ϵ_L, 3.14, ω_L, 2.81 [M]
(nat., cinnabar), HgS	8 1	cryst. frag.	ϵ_L, 3.146, ω_L, 2.819 [LB]
Viridian (chromium oxide, transparent), Cr_2O_3.-$2H_2O$	3 32	spherul. gr.	α, β_Σ1.82, γ_Σ2.12 [M*]
White lead (basic carbonate), $2PbCO_3.Pb(OH)_2$	6 70	v. fine cryst.	ϵ1.94, ω2.09 [M]
Zinc white (ordinary), ZnO	5 65	v. fine cryst gr.	ϵ2.02, ω2.00 [M]
(acicular), ZnO	...	spicules, fourlets	ϵ2 02, ω2.00 [M]
Zinc yellow, $ZnCrO_4$	3 46	min. spher. gr.	1.84–1.9 (irr.; bi.) [M*]

*

PHYSICAL PROPERTIES OF PIGMENTS (Continued)

[1] Abbreviations: art. = artificial; med. = medium; nat. = natural. The chemical formulas are those commonly accepted in chemical and mineralogical literature, but they may not compare exactly with structural formulas based on X-ray diffraction data or even on critical chemical analysis.

[2] The figures for specific gravity of the artificial pigments are mainly from H. A. Gardner, and those on the mineral pigments are chiefly from E. S. Larsen and H. Berman.

[3] Symmetry terms (monoclinic, orthorhombic, etc.) are omitted because pigments are so finely divided that it is rare when observations on crystal symmetry can be made. The term, "spherulitic," as used here means aggregates that tend toward radial structure and spherical shape. "Amorphous" describes materials that are microscopically formless but may be truly crystalline on the basis of X-ray diffraction data. Abbreviations: agg. = aggregate(s); amorph. = amorphous; comp. = composite; crypt. = cryptocrystalline; cryst = crystal(s); frag. = fragment(s); glob. = globule(s); gr. = grain(s); irr. = irregular; min. = minute, part = particle(s); prism. = prismatic; round. = rounded; spher. = spheroidal; spherul. = spherulitic; var. = variable; v = very; vitr. = vitreous.

[4] Unless otherwise indicated, all refractive index measurements are by sodium light. Σ is the symbol used by H. E. Merwin to indicate greater or less indefiniteness or irregularity in the case of aggregates, especially in respect to refractive index. Abbreviations: bi = birefringent; *c* = *circa;* ext. = extinction; isot. = isotropic; $\|$ = parallel; pleo. = pleochroic; s. = strongly; w. = weakly. The letters in brackets refer to the authorities for the refractive index data; M = H. E. Merwin; M* = H. E. Merwin, data by private communication, hitherto unpublished; W = C. D. West, data by private communication, hitherto unpublished; LB = E. S. Larsen and H. Berman; APL = A. P. Laurie and co-authors.

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ

Common Name	Chemical Name	Formula
Acetic ether	Ethyl acetate	$CH_3CO_2C_2H_5$
Acid of sugar	Oxalic acid	$(CO_2H)_2$
Aldehyde	Acetaldehyde	CH_3CHO
Alum Alum flour Alum meal	Generally refers to potassium aluminum sulfate	$K_2Al_2(SO_4)_4 \cdot 24H_2O$
Alumina	Aluminum oxide	Al_2O_3
Alumino-ferric	A mixture of aluminum and sodium sulfates	....
Alundum	Fused alumina	Al_2O_3
Aniline	Phenyl amine	$C_6H_5NH_2$
Aniline salt	Aniline hydrochloride	$C_6H_5NH_2 \cdot HCl$
Antichlor	Sodium thiosulfate	$Na_2S_2O_3 \cdot 5H_2O$
Antifebrin	Acetanilide	$C_6H_5NHCOCH_3$
Antimony bloom	Antimony trioxide	Sb_2O_3
Antimony black Antimony glance	Antimony trisulfide	Sb_2S_3
Antimony red Antimony vermilion	Antimonous oxysulfide	$Sb_2S_3 + Sb_2O_3$
Antimony white	Antimonous oxide	Sb_2O_3
Antimony yellow	Basic lead antimonate	$PbO\ Sb_2O_5$
Aqua fortis	Nitric acid	HNO_3
Aqua regia	Nitric acid and hydrochloric acid	$HNO_3 + 3HCl$
Argol	Crude potassium acid tartrate	$KHC_4H_4O_6$
Arsenic glass	Arsenous oxide	As_2O_3
Aspirin	Acetyl-salicylic acid	$C_6H_4(CO_2H)(OCOCH_3)$
Azurite	Basic copper carbonate	$2CuCO_3 \cdot Cu(OH)_2$
Bakelite	Resin from phenol + formaldehyde	....
Baking soda	Sodium bicarbonate	$NaHCO_3$
Barium white	Barium sulfate	$BaSO_4$
Baryta	Barium oxide	BaO
Barytes	Barium sulfate (natural)	$BaSO_4$
Bauxite	Hydrated alumina	$Al_2O_3 \cdot 2H_2O$
Beet sugar	Sucrose	$C_{12}H_{22}O_{11}$
Bentonite	Impure aluminum silicate	....
Benzine	Gasoline, petrol	....
Benzol	Benzene	C_6H_6
Bichrome	Potassium dichromate	$K_2Cr_2O_7$
Bitter salt	Magnesium sulfate	$MgSO_4 \cdot 7H_2O$
Black ash	Impure sodium carbonate	....
Blanc-fixe	Barium sulfate (artificial)	$BaSO_4$
Bleaching powder	Calcium chloro-hypochlorite	$CaOCl_2$
Blende	Natural zinc sulfide	ZnS
Blue copperas Blue stone Blue vitriol	Copper sulfate	$CuSO_4 \cdot 5H_2O$
Blue salts	Nickel sulfate	$NiSO_4 \cdot 7H_2O$
Blue verditer	Basic copper carbonate	$2CuCO_3 \cdot Cu(OH)_2$
Bone ash	Impure calcium phosphate	....
Bone black	Crude animal charcoal	C
Boracic acid	Boric acid	H_3BO_3
Borax	Sodium tetraborate	$Na_2B_4O_7 \cdot 10H_2O$
Bremen blue	Basic copper carbonate	$xCuCO_3 \cdot yCu(OH)_2$
Brimstone	Sulfur	S

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Burnt alum	Anhydrous potassium aluminum sulfate	$K_2Al_2(SO_4)_4$
Burnt lime	Calcium oxide	CaO
Burnt ochre; Burnt ore	Ferric oxide	Fe_2O_3
"Butter of"	Refers to the chloride	....
Cadmium yellow	Cadmium sulfide	CdS
Calamine	Zinc silicate	$2ZnO{\cdot}SiO_2{\cdot}H_2O$
Calcite	Mineral calcium carbonate	$CaCO_3$
Caliche	Impure sodium nitrate	$NaNO_3$
Calomel	Mercurous chloride	$HgCl$
Camphor, artificial	Pinene hydrochloride	$C_{10}H_{17}Cl$
Cane sugar	Sucrose	$C_{12}H_{22}O_{11}$
Carbolic acid	Phenol	C_6H_5OH
Carbonic acid; Carbonic anhydride	Carbon dioxide	CO_2
Carborundum	Silicon carbide	SiC
Carnallite	Magnesium potassium chloride	$MgCl_2\ KCl{\cdot}6H_2O$
"Caustic"	Refers to the hydroxide of a metal	....
Ceruse	Basic lead carbonate	$2PbCO_3{\cdot}Pb(OH)_2$
Chalk	Calcium carbonate	$CaCO_3$
Chili niter; Chili saltpeter	Sodium nitrate	$NaNO_3$
China clay	Aluminum silicate	$Al_2O_3{\cdot}2SiO_2{\cdot}2H_2O$
Chinese red	Basic lead chromate	$PbCrO_4{\cdot}PbO$
Chinese white	Zinc oxide	ZnO
Chloramine T	Sodium p-toluene-sulfochloramide	$(CH_3C_6H_4SO_2NCl\text{-}Na){\cdot}3H_2O$
Chloride of lime	Calcium chloro-hypochlorite	$CaOCl_2$
Chloride of soda	Sodium hypochlorite solution	$NaOCl$
Chrome alum	Potassium chromium sulfate	$K_2Cr_2(SO_4)_4{\cdot}24H_2O$
Chrome green	Chromium oxide	Cr_2O_3
Chrome red	Basic lead chromate	$PbCrO_4{\cdot}PbO$
Chrome yellow	Lead chromate	$PbCrO_4$
Chromic acid	Chromium trioxide	CrO_3
Cinnabar	Mercuric sulfide	HgS
Cobalt black	Cobalt oxide	CoO
Cobalt green	Cobalt zincate	$CoZnO_2$
Common salt	Sodium chloride	$NaCl$
Copperas	Ferrous sulfate	$FeSO_4{\cdot}7H_2O$
Corn sugar	Glucose	$C_6H_{12}O_6{\cdot}H_2O$
Corrosive sublimate	Mercuric chloride	$HgCl_2$
Corundum	Aluminum oxide	Al_2O_3
Cream of tartar	Potassium hydrogen tartrate	$KHC_4H_4O_6$
Cresylic acid	Mixture of *o*, *m*, and *p*-cresol	$CH_3C_6H_4OH$
Cupferron	Nitrosophenylhydroxylamine	$C_6H_5N(NO)OH$
Dekaline	Decahydronaphthalene	$C_{10}H_{18}$
Derby red	Basic lead chromate	$PbO{\cdot}PbCrO_4$
Derinatol	Basic bismuth gallate	$Bi(OH)_2{\cdot}C_7H_5O_5$
Dextrose	Glucose	$C_6H_{12}O_6{\cdot}H_2O$
Dutch liquid	Ethylene chloride	$(CH_2Cl)_2$

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Eau-de-Javelle	Potassium hypochlorite solution	$KOCl$
Eau-de-Labarraque	Sodium hypochlorite solution	$NaOCl$
Emerald green	Copper aceto-arsenite	$Cu(C_2H_3O_2)_2 \cdot 3Cu\text{-}As_2O_4$
Emery powder	Impure aluminum oxide	Al_2O_3
Epsom salts	Magnesium sulfate	$MgSO_4 \cdot 7H_2O$
Essence of bitter almonds	Benzaldehyde	C_6H_5CHO
Essence of mirbane	Nitrobenzene	$C_6H_5NO_2$
Everitt's salt	Potassium ferrous ferrocyanide	$K_2Fe_2(CN)_6$
Feldspar	Potassium aluminum silicate	$K_2Si_3O_7 \cdot Al_2Si_3O_9$
Ferro prussiate	Potassium ferrocyanide	$K_4Fe(CN)_6$
Fixed white	Barium sulfate	$BaSO_4$
Flowers of sulfur	Sulfur	S
"Flowers of" a metal is a	synonym for the oxide	
Fluorspar	Calcium fluoride	CaF_2
Formalin	Forty per cent solution of formaldehyde in water	$HCHO$
Formin	Hexamethylene tetramine	$(CH_2)_6N_4$
Freezing salt	Crude sodium chloride	$NaCl$
French chalk	Hydrated silicate of magnesium	$Mg_3Si_4O_{11} \cdot H_2O$
French verdigris	Basic copper acetate	$Cu_2(C_2H_3O_2)_3(OH)_2$
Fruit sugar	Fructose	$C_6H_{12}O_6$
Fuller's earth	Hydrated magnesium and aluminum silicates	....
Fulminate of mercury	Mercuric fulminate	$Hg(ONC)_2$
Fusel oil	Mixed amyl alcohols	$C_5H_{11}OH$
Gasoline	Benzine, petrol	....
Galena	Natural lead sulfide	PbS
Glauber's salt	Sodium sulfate	$Na_2SO_4 \cdot 10H_2O$
Glucose	Dextrose	$C_6H_{12}O_6 \cdot H_2O$
Glycerin	Glycerol	$C_3H_5(OH)_3$
Grain alcohol	Ethyl alcohol	C_2H_5OH
Grape sugar	Glucose	$C_6H_{12}O_6 \cdot H_2O$
Green verditer	Basic copper carbonate	$CuCO_3 \cdot Cu(OH)_2$
Green vitriol	Ferrous sulfate	$FeSO_4 \cdot 7H_2O$
Gypsum	Calcium sulfate	$CaSO_4 \cdot 2H_2O$
Hartshorn salt	Ammonium carbonate carbamate	$NH_4HCO_3 \cdot NH_4CO_2\text{-}NH_2$
Heavy spar	Barium sulfate	$BaSO_4$
Hexamine	Hexamethylene tetramine	$(CH_2)_6N_4$
Horn silver	Silver chloride	$AgCl$
Hydrosulfite	Sodium hyposulfite	$Na_2S_2O_4$
Hypo	Sodium thiosulfate	$Na_2S_2O_3 \cdot 5H_2O$
Iron black	Precipitated antimony	Sb
Indian red	Ferric oxide	Fe_2O_3
Iron mordant	Ferric sulfate	$Fe_2(SO_4)_3$
Kainit	Double salt of potassium magnesium sulfate and magnesium chloride	$K_2Mg(SO_4)_2 \cdot MgCl_2\text{-}6H_2O$
Kaolin	Aluminum silicate	$Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$
Kieselguhr	Siliceous earth	SiO_2
Kieserite	Mineral magnesium sulfate	$MgSO_4$
King's yellow	Arsenous sulfide	As_2S_3
Lampblack	Impure carbon	C

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Lanolin	Cholesterol	$C_{27}H_{46}O$
Laughing gas	Nitrous oxide	N_2O
Lemon chrome	Barium chromate	$BaCrO_4$
Levulose	Fructose	$C_6H_{12}O_6$
Lime	Calcium oxide	CaO
Litharge	Lead monoxide	PbO
Lithopone	Zinc sulfide + barium sulfate	$ZnS + BaSO_4$
Liver of sulfur	Mixed potassium sulfides	....
Lunar caustic	Silver nitrate	$AgNO_3$
Lysol	Cresol soap solution	....
Magnesia	Magnesium oxide	MgO
Magnesite	Magnesium carbonate	$MgCO_3$
Malachite	Basic copper carbonate	$CuCO_3 \cdot Cu(OH)_2$
Manganese black	Manganese dioxide	MnO_2
Marble	Calcium carbonate	$CaCO_3$
Marsh gas	Methane	CH_4
Massicot	Lead monoxide	PbO
Methanol	Methyl alcohol	CH_3OH
Metol	*p*-Monomethylamine-*m*-cresol sulfate or chloride	$[C_6H_3(OH)CH_3NH\text{-}CH_3]_2 \cdot H_2SO_4$

Silica	Silicon dioxide	SiO_2
Slaked lime	Calcium hydroxide	$Ca(OH)_2$
Soda (washing)	Sodium carbonate	$Na_2CO_3\cdot 10H_2O$
Soda crystals	Sodium carbonate	$Na_2CO_3\cdot 10H_2O$
Soda lime	Mixture of calcium oxide and sodium hydroxide	CaO + NaOH
Sodium hyposulfite	Sodium thiosulfate	$Na_2S_2O_3\cdot 5H_2O$
Soft soap	Potash soap	.....
Soluble glass	Sodium silicate	$Na_2SiO_3 + H_2O$
Soluble tartar	Potassium tartrate	$2K_2C_4H_4O_6\cdot H_2O$
Spirit of hartshorn	Ammonia solution	NH_4OH
Spirit of salt	Hydrochloric acid	HCl
Spirit of wine	Ethyl alcohol	C_2H_5OH

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Stassfurtite	Magnesium borate and chloride double salt	$2Mg_3B_2O_{15} \cdot MgCl_2$
Sugar of lead	Lead acetate	$Pb(C_2H_3O_2)_2 \cdot 3H_2O$
Sugar of milk	Lactose	$C_{12}H_{22}O_{11} \cdot H_2O$
Sulfuric ether	Diethyl ether	$(C_2H_5)_2O$
Superphosphate	Impure calcium acid phosphate	$CaH_4(PO_4)_2$
Sylvine	Potassium chloride	KCl
Sylvinite	Sylvine with rock salt	....
Table salt	Sodium chloride	NaCl
Talc	Hydrated magnesium silicate	$Mg_3Si_4O_{11} \cdot H_2O$
Tartar	Crude potassium bitartrate	$KHC_4H_4O_6$
Tartar emetic	Potassium antimonyl tartrate	$2K(SbO)C_4H_4O_6 \cdot H_2O$
Tetralin	Tetrahydronaphthalene	$C_{10}H_{12}$
Tin crystals	Stannous chloride	$SnCl_2$
Tin white	Stannic hydroxide	$Sn(OH)_4$
T. N. T.	Trinitrotoluene	$C_6H_2(CH_3)(NO_2)_3$ (1, 2, 4, 6)
Toluol	Toluene	$C_6H_5CH_3$
Trona	Natural sodium carbonate	$Na_2CO_3.NaHCO_3.3H_2O$
Turnbull's blue	Ferrous ferricyanide	$Fe_3[Fe(CN)_6]_2$
Ultramarine yellow	Barium chromate	$BaCrO_4$
Unslaked lime	Calcium oxide	CaO
Vanillin	Methyl ether of protocatechualdehyde	$C_6H_3(OH)(OCH_3)$-CHO(1, 2, 4)
Venetian red	Ferric oxide	Fe_2O_3
Verdigris	Basic copper acetate	$2Cu(C_2H_3O_2)_2 + CuO(?)$
Vermilion	Red mercuric sulfide	HgS
Vitriol	Sulfuric acid	H_2SO_4
"Vitriolate of"	"Sulfate of"	....
Washing soda	Sodium carbonate	$Na_2CO_3 \cdot 10H_2O$
Water glass	Sodium silicates dissolved in water	....
White acid	Hydrofluoric acid and ammonium fluoride	$H_2F_2 + NH_4F$
White arsenic	Arsenous oxide	As_2O_3
White lead	Basic lead carbonate	$2PbCO_3 + Pb(OH)$
White vitriol	Zinc sulfate	$ZnSO_4 \cdot 7H_2O$
Whiting	Calcium carbonate	$CaCO_3$
Witherite	Barium carbonate	$BaCO_3$
Wood alcohol Wood naphtha Wood spirit	Methyl alcohol	CH_3OH
Xylol	Xylene	$C_6H_4(CH_3)_2$
Yellow prussiate of potash	Potassium ferrocyanide	$K_4Fe(CN)_6 \cdot 3H_2O$
Zinc blende	Mineral zinc sulfide	ZnS
Zinc vitriol	Zinc sulfate	$ZnSO_4 \cdot 7H_2O$
Zinc white	Zinc oxide	ZnO

Pigments named in the above list refer to the pure substance and not to mixtures often sold under the same name.

TRADE NAMES OF DYESTUFF INTERMEDIATES

Trade Name	Chemical Name
A acid	1, 7-Dihydroxynaphthalene-3, 6-disulfonic acid
Alizarin	1, 2-dihydroxyanthraquinone
Amino-G acid	2-Naphthylamine-6, 8-disulfonic acid
Amino-R acid	2-Naphthylamine-3, 6-disulfonic acid
Andresen's acid	1-Naphthol-3, 8-disulfonic acid
Anisidine	o-Aminophenol methyl ether
Anthrachrysone	1, 3, 5, 7-Tetrahydroxyanthraquinone
Anthraflavic acid	2, 6-Dihydroxyanthraquinone
Anthranilic acid	o-Aminobenzoic acid
Anthrarufin	1, 5-Dihydroxyanthraquinone
Armstrong's acid	Naphthalene-1, 5-disulfonic acid
Badische acid	2-Naphthylamine-8-sulfonic acid
Bayer's acid	2-Naphthol-8-sulfonic acid
Benzidine	p, p′-Diamino-diphenyl
Brönner's acid	2-Naphthylamine-6-sulfonic acid
β acid	Anthraquinone-2-sulfonic acid
Chromotrope acid	1, 8-Dihydroxynaphthalene-3, 6-disulfonic acid
Chrysazin	1, 8-Dihydroxyanthraquinone
Cleve's acids	1-Naphthylamine-6- and -7-sulfonic acids
Cleve's acid	1-Naphthylamine-5-sulfonic acid
Cleve's acid	1-Naphthylamine-6-sulfonic acid
Cleve's acid	1-Naphthylamine-3-sulfonic acid
Cleve's acid	1-Naphthylamine-7-sulfonic acid
Cresotic acids	Cresol carboxylic acids
Croceine acid	2-Naphthol-8-sulfonic acid
Dahl's acid	2-Naphthylamine-5-sulfonic acid
Dahl's acid II	1-Naphthylamine-4, 6-disulfonic acid
Dahl's acid III	1-Naphthylamine-4, 7-disulfonic acid
Disulpho acid S	1-Naphthylamine-4, 8-disulfonic acid
DTS	Dehydrothio-p-toluidine sulfonic acid
δ acid	1-Naphthol-4, 8-disulfonic acid 1-Naphthylamine-4, 8-disulfonic acid
Ebert and Merz's acid	Naphthalene-2, 7-disulfonic acid
Ebert and Merz's acid	Naphthalene-2, 6-disulfonic acid
Ewer and Pick's acid	Naphthalene-1, 6-disulfonic acid
ε acid	1-Naphthol-3, 8-disulfonic acid 1-Naphthylamine-3, 8-disulfonic acid
F acid	2-Naphthol-7-sulfonic acid
Freund's acid	1-Naphthylamine-3, 6-disulfonic acid
G acid	2-Naphthol-6, 8-disulfonic acid
Gallic acid	3, 4, 5-Trihydroxybenzoic acid
γ-acid	2-Amino-8-naphthol-6-sulfonic acid
H acid	1-Amino-8-naphthol-3, 6-disulfonic acid
Histazarin	2, 3-Dihydroxyanthraquinone
Isoanthraflavic acid	2, 7-Dihydroxyanthraquinone
J acid	2-Amino-5-naphthol-7-sulfonic acid
K acid	1-Amino-8-naphthol-4, 6-disulfonic acid
Kalle's acid	1-Naphthylamine-2, 7-disulfonic acid
Ketone base	Tetramethyldiaminobenzophenone
Koch's acid	1-Naphthylamine-3, 6, 8-trisulfonic acid
L acid	1-Naphthol-5-sulfonic acid
Laurent's acid	1-Naphthylamine-5-sulfonic acid
Lepidine	4-Methylquinoline
Leucotrope	Phenyldimethylbenzylammonium chloride
M acid	1-Amino-5-naphthol-7-sulfonic acid
Mesidine	2, 4, 6-Trimethylaniline
Metanilic acid	Aniline-m-sulfonic acid
Michler's ketone	Tetramethyldiaminobenzophenone
Naphthazarin	5, 6-Dihydroxy-1, 4-naphthoquinone
Naphthionic acid	1-Naphthylamine-4-sulfonic acid
o-Naphthionic	1-Naphthylamine-2-sulfonic acid
Naphthol A. S.	Anilide of -hydroxynaphthoic acid

TRADE NAMES OF DYESTUFF INTERMEDIATES
(Continued)

Trade Name	Chemical Name
Naphthoresorcin	1, 3-Dihydroxynaphthalene
Nevile and Winther's acid	1-Naphthol-4-sulfonic acid
Nigrotic acid	1, 7, 3, 6-Dihydroxysulfonaphthoic acid
Nitroso base	p-Nitrosodimethylaniline
NW acid	Nevile and Winther's acid
Peri acid	1-Naphthylamine-8-sulfonic acid
p-Phenetidine	p-Aminophenol ethyl ether
Phenyl-gamma acid	2-Phenylamino-8-naphthol-6-sulfonic acid
Phenyl Peri acid	Phenyl-1-naphthylamine-8-sulfonic acid
Phosgene	Carbonyl chloride
Phthalic acid	o-Benzenedicarboxylic acid
Picramic acid	2-Amino-4, 6-dinitrophenol
Picric acid	2, 4, 6-Trinitrophenol
Primuline base	p-Toluidine heated with sulfur.
Purpurin	1, 2, 4-Trihydroxyanthraquinone
Pyrogallol	1, 2, 3-Trihydroxybenzene
Quinaldine	2-Methylquinoline
Quinazarin	1, 4-Dihydroxyanthraquinone
R acid	2-Naphthol-3, 6-disulfonic acid
2 R acid	2-Amino-8-naphthol-3, 6-disulfonic acid
Red acid	1, 5-Dihydroxynaphthalene-3, 7-disulfonic acid
RG acid	1-Naphthol-3, 6-disulfonic acid
Resorcinol	1, 3-Dihydroxybenzene
S acid	1-Amino-8-naphthol-4-sulfonic acid
2 S acid	1-Amino-8-naphthol-2, 4-disulfonic acid
Salicylic acid	o-Hydroxybenzoic acid
Schaffer's acid	2-Naphthol-6-sulfonic acid
Schollkopf's acid	1-Naphthol-4, 8-disulfonic acid 1-Naphthylamine-4, 8-disulfonic acid 1-Naphthylamine-8-sulfonic acid
Sulfanilic acid	Aniline-p-sulfonic acid
Thiocarbanilide	Diphenylthiourea
Tobias acid	2-Naphthylamine-1-sulfonic acid
Tolidine	Di-p-aminoditolyl
Toluidine	Amino toluene
Xylidine	Amino xylene
Yellow acid	1, 3-Dihydroxynaphthalene-5, 7-disulfonic acid

THE PRONUNCIATION OF CHEMICAL WORDS

Reprinted by permission from a report of the Nomenclature, Spelling, and Pronunciation Committee of the American Chemical Society* as published in News Edition, Industrial and Engineering Chemistry, **12**, 202 (1934).

GENERALIZATIONS

(1) Accenting names of chemical substances on the final syllable is to be discouraged in all cases where the preference for such an accent is not emphatic. The names *amine*, *arsine*, *quinone*, and *sulfone* and words ending in these names (also the suffix *-phenone*) represent most of the exceptions. The general trend of the accent in the English language is recognized by authorities to be away from the end and toward the beginning of the word. However, when the last syllable of a word is a significant suffix, as *-al* for aldehydes, it is not slurred by chemists.

(2) In the interest of uniformity and in accordance with a general trend of English pronunciation in America, the ending *-ide* should be pronounced *-īd*. This appears to be uniformly the practice in inorganic chemistry. Many organic names are so pronounced also. Certain organic terms, however, are pronounced *-ĭd* by many, as *acetanilide*, *imide*, *phthalimide*, *lipide*, *amide*, and several words ending in *-amide*.

(3) For chemical names ending in *-ine*, usage is divided between the pronunciations *-ēn* and *-ĭn*, with a tendency in favor of *-ēn*. Since a distinction in spelling is made by many between names of bases ending in *-ine* and names of nonbases ending in *-in*, the pronunciation *-ēn* for the ending *-ine* is to be encouraged. (It is unfortunate that this conflicts in sound with the pronunciation of the ending *-ene*, but it is believed that this will cause confusion only with a very few words, as benzine and benzene, fluorine and fluorene. As to the pronunciation *-īn*, usage, at least in America, is very strongly against it, and it would conflict with the pronunciation of the new ending *-yne* adopted for names of acetylene hydrocarbons.) Quinine, because of strong popular usage, is an exception.

(4) The pronunciation *-ōl* for the ending of names of alcohols and phenols (except the word alcohol itself!), whether regrettable or not, seems firmly fixed and should be recognized. Emphasis on a significant ending is probably an influence in this practice. Chemical terms not belonging to the above classes, but generally pronounced *-ōl*, should be spelled with a final *e*; examples, *mole*, *pyrrole*. This is in accordance with the recommendation of the International Committee on Organic Nomenclature. For *sol* and words ending in *-sol*, the spelling *-ol* and the pronunciation *-ŏl* should be encouraged.

(5) The ending *-yl* should be pronounced *-ĭl*. The pronunciation *-ēl* is apparently a Germanism and, although still in use

* The members of this committee are Austin M. Patterson, C. A. Jacobson, H. E. Howe, Arthur B. Lamb, E. J. Crane, *Chairman*, and the Board of Associate Editors of the *Journal of the Amerıcal Chemical Society*.

to some extent is to be discouraged. The pronunciation -*īl*, apparently common in England, is seldom heard in the United States.

(6) The ending -*ile* (as in nitrile). Usage is divided among the pronunciations -*īl*, -*ĭl*, and -*ēl*. The second of these is identical with the pronunciation recommended for -*yl*, and the third is apparently a Germanism. The pronunciation -*īl* should be favored.

(7) The endings -*acic*, -*alic*, -*anic*, -*aric*, -*elic*, *enic*, -*eric*, -*etic*, -*idic*, -*ilic*, -*inic*, -*isic*, -*onic*, -*opic*, -*oric*. A rather extensive study of the pronunciation of such endings shows a preference for a *short* vowel preceding -*ic* in all but a few cases. This result is in accord with age-old general English usage and is to be approved. *Acetic* (ă-sē'tĭk) is a very emphatic exception. Other exceptions are *cetic* (sē'tĭk) and *ceric* (sē'rĭk) and adjectives derived from the names of unsaturated hydrocarbons (because of the influence of the significant -*ene* ending).

(8) The ending -*olic*. This ending is an exception to the rule for words ending in -*ic* [compare (7)], perhaps owing to the influence of words ending in -*ol*. Inasmuch as ten cases out of twelve studied favor the long *ō*, some of them by very large majorities, it is recommended that this ending be uniformly pronounced -*ō'lik*.

(9) Adjectives ending in -*ic* should be accented on the next to the last syllable, as glycer'ic, not gly'ceric. In names of salts the accent, following the trend indicated in (1) above, usually moves one syllable (occasionally more) towards the beginning of the word, as gly'cerate, sal'icylate.

(10) The ending -*ime*. In oxime, at least, this should be pronounced -*ēm*, to accord with usage, though this is contrary to the normal English trend.

(11) The ending -*oin* should be pronounced as two syllables, -*ō-ĭn*, with the accent coming on the preceding syllable (as, bĕn'zō-ĭn, fū'rō-ĭn). In certain words where the addition of a chemical suffix causes two vowels to come together there is a natural tendency to merge them and thus change their sound, as thebaine, linalool. While concession must be made to usage in particular cases, as cocaine, the pronunciation of such vowels separately is to be encouraged. The use of the dieresis is helpful, as linaloöl.

(12) Words ending in -*valent* should be so pronounced that the last two syllables are -vā'lĕnt; as trī-vā'lĕnt (not trĭv'â-lĕnt).

THE WORD LIST

The words listed below are, except for a few deletions, the ones on which the committee's study was based. After each word there is given one or more pronunciations (shown by respelling and the use of symbols as explained at the head of

the list). When only a single pronunciation is shown this means that usage and perhaps other influences are so strongly in favor of it that no alternative is proposed. When more than one pronunciation is shown an attempt has been made to place these in the order of preference. The provision of two, occasionally three, pronunciations indicates that usage is divided without a marked show of preference (this is true of many words throughout the English language), or that there is some conflict between usage and the other influences properly taken into consideration. The word "usage" in parentheses following a pronunciation signifies that usage supports it to a considerable extent, notwithstanding other dictates.

Again let it be said that there is no attempt to proclaim "This pronunciation is right and this one is wrong." Usage, chemical nomenclature considerations, derivation, and the rules of good English (a compromise has sometimes been necessary) suggest certain preferences and these we have tried to ascertain.

Key to Pronunciation

The symbols used in the respelling for pronunciation have the following values: āle, senȧte, ăm, *ă*ccount, ärm; ēve, ėvent, ĕnd, rec*ĕ*nt, makẽr; īce, ĭll; ōld, ȯbey, ôrb, ŏdd, c*ŏ*nnect; ūse, u̇nite, ûrn, ŭp, circ*ŭ*s; fo͞od; oil; **ch**air; **g**o; **th**in.

GENERAL CHEMICAL TABLES

FLAME AND BEAD TESTS

Flame Colorations

VIOLET

Potassium compounds. Purple red through blue glass. Easily obscured by sodium flame. Bluish green through green glass. Rubidium and Caesium compounds impart same flame as potassium compounds.

BLUES

Azure.—Copper chloride. Copper bromide gives azure blue followed by green. Other copper compounds give same coloration when moistened with hydrochloric acid.

Light Blue.—Lead, Arsenic, Selenium.

GREENS

Emerald.—Copper compounds except the halides, and when not moistened with hydrochloric acid.

Pure Green.—Compounds of thallium and tellurium.

Yellowish.—Barium compounds. Some molybdenum compounds. Borates, especially when treated with sulphuric acid or when burned with alcohol.

Bluish.—Phosphates with sulphuric acid.

Feeble.—Antimony compounds. Ammonium compounds.

Whitish.—Zinc.

REDS

Carmine.—Lithium compounds. Violet through blue glass. Invisible through green glass. Masked by barium flame.

Scarlet.—Strontium compounds. Violet through blue glass. Yellowish through green glass. Masked by barium flame.

Yellowish.—Calcium compounds. Greenish through blue glass. Green through green glass. Masked by barium flame.

YELLOW

Yellow.—All sodium compounds. Invisible with blue glass.

Borax Beads

Abbreviations employed: s., saturated; s.s., supersaturated; n.s., not saturated; h , hot; c , cold.

Substance	Oxidizing flame	Reducing flame
Aluminum	Colorless (h.c , n.s.); opaque (s.s.)	Colorless; opaque (s.)
Antimony	Colorless; yellow or brownish (h., s s)	Gray and opaque
Barium	Colorless (n s.)	....
Bismuth	Colorless; yellow or brownish (h., s.s.)	Gray and opaque
Cadmium	Colorless	Gray and opaque
Calcium	Colorless (n s.)	....
Cerium	Red (h.)	Colorless (h.c.)
Chromium	Green (c.)	Green
Cobalt	Blue (h.c.)	Blue (h.c.)
Copper	Green (h); blue (c.)	Red (c): opaque (s.s.): colorless (h.)

FLAME AND BEAD TESTS (Continued)

Borax Beads (Continued)

Substance	Oxidizing flame	Reducing flame

Uranium	Green; yellow or brownish (h , s)	Green (h)
Vanadium	Yellow	Green
Zinc	Colorless (n s.)	Gray and opaque

Sodium Carbonate Bead

Manganese	Green	Colorless

PREPARATION OF REAGENTS

The following pages present directions for the preparation of various reagents. The collection has been prepared with the active collaboration of W. D. Bonner, R. K. Carleton, L. L. Carrick, Giles B. Cooke, E. J. Cragoe, Thos. De Vries, James L. Kassner, Thos. W. Mason, F. C. Mathers, M. G. Mellon, W. C. Pierce, J. H. Reedy, Arthur A. Vernon and S. R. Wood. Many others have contributed valuable suggestions.

Volumes have been stated in milliliters (ml) and liters (l). One milliliter is equivalent to 1.000027 cubic centimeters (cm^3 or cc.). Masses are indicated in grams (g).

The relation to molar solution (*M*) or normal solution (*N*) is indicated in many cases.

Distilled water should be used.

LABORATORY REAGENTS FOR GENERAL USE

DILUTE ACIDS, 3 molar. Use the amount of concentrated acid indicated and dilute to one liter.

Acetic acid, 3 *N*. Use 172 ml of 17.4 *M* acid (99–100%).

Hydrochloric acid, 3 *N*. Use 258 ml of 11.6 *M* acid (36% HCl).

Nitric acid, 3 *N*. Use 195 ml of 15.4 *M* acid (69% HNO_3).

Phosphoric acid, 9 *N*. Use 205 ml of 14.6 *M* acid (85% H_3PO_4).

Sulfuric acid, 6 *N*. Use 168 ml of 17.8 *M* acid (95% H_2SO_4).

DILUTE BASES.

Ammonium hydroxide, 3 *M*, 3 *N*. Dilute 200 ml of concentrated solution (14.8 *M*, 28% NH_3) to 1 liter.

Barium hydroxide, 0.2 *M*, 0.4 *N*. Saturated solution, 63 g per liter of $Ba(OH)_2.8H_2O$. Use some excess, filter off $BaCO_3$ and protect from CO_2 of the air with soda lime or ascarite in a guard tube.

Calcium hydroxide, 0.02 *M*, 0.04 *N*. Saturated solution, 1.5 g per liter of $Ca(OH)_2$. Use some excess, filter off $CaCO_3$ and protect from CO_2 of the air.

Potassium hydroxide, 3 *M*, 3 *N*. Dissolve 176 g of the sticks (95%) in water and dilute to 1 liter.

Sodium hydroxide, 3 *M*, 3 *N*. Dissolve 126 g of the sticks (95%) in water and dilute to 1 liter.

GENERAL REAGENTS. (See also *Standard Solutions for Volumetric Analysis*, and *Decinormal Solutions of Salts and Other Reagents*.)

Aluminum chloride, 0.167 *M*, 0.5 *N*. Dissolve 22 g of $AlCl_3$ in 1 liter of water.

Aluminum nitrate, 0.167 *M*, 0.5 *N*. Dissolve 58 g of $Al(NO_3)_3.7.5H_2O$ in 1 liter of water.

Aluminum sulfate, 0.083 *M*, 0.5 *N*. Dissolve 56 g of $Al_2(SO_4)_3.18H_2O$ in 1 liter of water.

Ammonium acetate, 3 *M*, 3 *N*. Dissolve 230 g of $NH_4C_2H_3O_2$ in water and dilute to 1 liter.

Ammonium carbonate, 1.5 *M*. Dissolve 144 g of the commercial salt (mixture of $(NH_4)_2CO_3.H_2O$ and $NH_4CO_2NH_2$) in 500 ml of 3 *N* NH_4OH and dilute to 1 liter.

Ammonium chloride, 3 *M*, 3 *N*. Dissolve 160 g of NH_4Cl in water. Dilute to 1 liter.

Ammonium molybdate.

1. 0.5 *M*, 1 *N*. Mix well 72 g of pure MoO_3 (or 81 g of H_2MoO_4) with 200 ml of water, and add 60 ml of conc. ammonium hydroxide. When solution is complete, filter and pour filtrate, *very slowly* and with *rapid stirring*, into a mixture of 270 ml of conc. HNO_3 and 400 ml of water. Allow to stand over night, filter and dilute to 1 liter.

2. The reagent is prepared as two solutions which are mixed as needed, thus always providing fresh reagent of proper strength and composition. Since ammonium molybdate is an expensive reagent, and since an acid solution of this reagent as usually prepared keeps for only a few days, the method proposed will avoid loss of reagent and provide more certain results for quantitative work.

Solution 1. Dissolve 100 g of ammonium molybdate (C.P. grade) in 400 ml of water and 80 ml of 15 *M* NH_4OH. Filter if necessary, though this seldom has to be done.

Solution 2. Mix 400 ml of 16 *M* nitric acid with 600 ml of water.

For use, mix the calculated amount of solution 1 with twice its volume of solution 2, adding solution 1 to solution 2 slowly, with vigorous stirring. Thus, for amounts of phosphorus up to 20 mg, 10 ml of solution 1 to 20 ml of solution 2 is adequate. Increase amount as needed.

Ammonium nitrate, 1 *M*, 1 *N*. Dissolve 80 g of NH_4NO_3 in 1 liter of water.

Ammonium oxalate, 0.25 *M*, 0.5 *N*. Dissolve 35.5 g of $(NH_4)_2C_2O_4.H_2O$ in water. Dilute to 1 liter.

Ammonium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 33 g of $(NH_4)_2SO_4$ in 1 liter of water.

Ammonium sulfide, colorless.

1. 3 *M*. Treat 200 ml of conc. NH_4OH with H_2S until saturated, keeping the solution cold. Add 200 ml of conc. NH_4OH and dilute of 1 liter.

2. 6 *N*. Saturate 6 *N* ammonium hydroxide (40 ml conc. ammonia solution + 60 ml H_2O) with washed H_2S gas. The ammonium hydroxide bottle must be completely full and must be kept surrounded by ice while being saturated (about 48 hours for two liters). The reagent is best preserved in brown, completely filled, glass-stoppered bottles.

Ammonium sulfide, yellow. Treat 150 ml of conc. NH_4OH with H_2S until saturated, keeping the solution cool. Add 250 ml of conc. NH_4OH and 10 g of powdered sulfur. Shake the mixture until the sulfur is dissolved and dilute to 1 liter with water. In the solution the concentration of $(NH_4)_2S_2$, $(NH_4)_2S$ and NH_4OH are 0.625, 0.4 and 1.5 normal respectively. On standing, the concentration of $(NH_4)_2S_2$ increases and that of $(NH_4)_2S$ and NH_4OH decreases.

Antimony pentachloride, 0.1 *M*, 0.5 *N*. Dissolve 30 g of $SbCl_5$ in 1 liter of water.

Antimony trichloride, 0.167 *M*, 0.5 *N*. Dissolve 38 g of $SbCl_3$ in 1 liter of water.

Aqua regia. Mix 1 part concentrated HNO_3 with 3 parts of concentrated HCl. This formula should include one volume of water if the aqua regia is to be stored for any length of time. Without water, objectionable quantities of chlorine and other gases are evolved.

Barium chloride, 0.25 *M*, 0.5 *N*. Dissolve 61 g of $BaCl_2.2H_2O$ in water. Dilute to 1 liter.

Barium hydroxide, saturated solution, 0.1 *M*, about 0.2 *N*. Dissolve 32 g of $Ba(OH)_2.8H_2O$ in 1 liter of water.

Barium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 65 g of $Ba(NO_3)_2$ in 1 liter of water.

Bismuth chloride, 0.167 *M*, 0.5 *N*. Dissolve 53 g of $BiCl_3$ in 1 liter of dilute HCl. Use 1 part HCl to 5 parts water.

Bismuth nitrate, 0.083 *M*, 0.25 *N*. Dissolve 40 g of $Bi(NO_3)_3.5H_2O$ in 1 liter of dilute HNO_3. Use 1 part of HNO_3 to 5 parts of water.

Cadmium chloride, 0.25 *M*, 0.5 *N*. Dissolve 46 g of $CdCl_2$ in 1 liter of water.

Cadmium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 77 g of $Cd(NO_3)_2.4H_2O$ in 1 liter of water.

Cadmium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 70 g of $CdSO_4.4H_2O$ in 1 liter of water.

Calcium chloride, 0.25 *M*, 0.5 *N*. Dissolve 55 g of $CaCl_2.6H_2O$ in water. Dilute to 1 liter.

Calcium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 41 g of $Ca(NO_3)_2$ in 1 liter of water.

Chloroplatinic acid.

1. 0.0512 *M*, 0.102 *N*. Dissolve 26.53 g of $H_2PtCl_6.6H_2O$ in water. Dilute to 100 ml. Contains 0.100 g Pt per ml.

2. Make a 10% solution by dissolving 1 g of $H_2PtCl_6.6H_2O$ in 9 ml of water. Shake thoroughly to insure complete mixing. Keep in a dropping bottle.

Chromic chloride, 0.167 *M*, 0.5 *N*. Dissolve 26 g of $CrCl_3$ in 1 liter of water.

Chromic nitrate, 0.167 *M*, 0.5 *N*. Dissolve 40 g of $Cr(NO_3)_3$ in 1 liter of water.

Chromic sulfate, 0.083 *M*, 0.5 *N*. Dissolve 60 g of $Cr_2(SO_4)_3.18H_2O$ in 1 liter of water.

Cobaltous nitrate, 0.25 *M*, 0.5 *N*. Dissolve 73 g of $Co(NO_3)_2.6H_2O$ in 1 liter of water.

Cobaltous sulfate, 0.25 *M*, 0.5 *N*. Dissolve 70 g of $CoSO_4.7H_2O$ in 1 liter of water.

Cupric chloride, 0.25 *M*, 0.5 *N*. Dissolve 43 g of $CuCl_2.$-$2H_2O$ in 1 liter of water.

Cupric nitrate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of $Cu(NO_3)_2.$-$6H_2O$ in 1 liter of water.

Cupric sulfate, 0.5 *M*, 1 *N*. Dissolve 124.8 g of $CuSO_4.$-$5H_2O$ in water to which 5 ml of H_2SO_4 has been added. Dilute to 1 liter.

Ferric chloride, 0.5 *M*, 1.5 *N*. Dissolve 135.2 g of $FeCl_3.$-$6H_2O$ in water containing 20 ml of conc. HCl. Dilute to 1 liter.

Ferric nitrate, 0.167 *M*, 0.5 *N*. Dissolve 67 g of $Fe(NO_3)_3.$-$9H_2O$ in 1 liter of water.

Ferric sulfate, 0.25 *M*, 0.5 *N*. Dissolve 140.5 g of Fe_2-$(SO_4)_3.9H_2O$ in water containing 100 ml of conc. H_2SO_4. Dilute to 1 liter.

Ferrous ammonium sulfate, 0.5 *M*, 1 *N*. Dissolve 196 g of $Fe(NH_4SO_4)_2.6H_2O$ in water containing 10 ml of conc. H_2SO_4. Dilute to 1 liter. Prepare fresh solutions for best results.

Ferrous sulfate, 0.5 *M*, 1 *N*. Dissolve 139 g of $FeSO_4.7H_2O$ in water containing 10 ml of conc. H_2SO_4. Dilute to 1 liter. Solution does not keep well.

Lead acetate, 0.5 *M*, 1 *N*. Dissolve 190 g of $Pb(C_2H_3O_2)_2.$-$3H_2O$ in water. Dilute to 1 liter.

Lead nitrate, 0.25 *M*, 0.5 *N*. Dissolve 83 g of $Pb(NO_3)_2$ in 1 liter of water.

Lime water. See *Calcium hydroxide*.

Magnesium chloride, 0.25 *M*, 0.5 *N*. Dissolve 51 g of $MgCl_2.6H_2O$ in 1 liter of water.

Magnesium chloride reagent. Dissolve 50 g of $MgCl_2.$-$6H_2O$ and 100 g of NH_4Cl in 500 ml of water. Add 10 ml of conc. NH_4OH, allow to stand over night and filter if a precipitate has formed. Make acid to methyl red with dilute HCl. Dilute to 1 liter. Solution contains 0.25 *M* $MgCl_2$ and 2 *M* NH_4Cl. Solution may also be diluted with 133 ml of conc. NH_4OH and water to make 1 liter. Such a solution will contain 2 *M* NH_4OH.

Magnesium nitrate, 0.25 *M*, 0.5 *N*. Dissolve 64 g of $Mg(NO_3)_2.6H_2O$ in 1 liter of water.

Magnesium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 62 g of $MgSO_4.7H_2O$ in 1 liter of water.

Manganous chloride, 0.25 *M*, 0.5 *N*. Dissolve 50 g of $MnCl_2.4H_2O$ in 1 liter of water.

Manganous nitrate, 0.25 *M*, 0.5 *N*. Dissolve 72 g of $Mn(NO_3)_2.6H_2O$ in 1 liter of water.

Manganous sulfate, 0.25 *M*, 0.5 *N*. Dissolve 69 g of $MnSO_4.7H_2O$ in 1 liter of water.

Mercuric chloride, 0.25 *M*, 0.5 *N*. Dissolve 68 g of $HgCl_2$ in water. Dilute to 1 liter.

Mercuric nitrate, 0.25 *M*, 0.5 *N*. Dissolve 81 g of $Hg(NO_3)_2$ in 1 liter of water.

Mercuric sulfate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of $HgSO_4$ in 1 liter of water.

Mercurous nitrate. Use 1 part $HgNO_3$, 20 parts water and 1 part HNO_3.

Nickel chloride, 0.25 *M*, 0.5 *N*. Dissolve 59 g of $NiCl_2 \cdot 6H_2O$ in 1 liter of water.

Nickel nitrate, 0.25 *M*, 0.5 *N*. Dissolve 73 g of $Ni(NO_3)_2 \cdot 6H_2O$ in 1 liter of water.

Nickel sulfate, 0.25 *M*, 0.5 *N*. Dissolve 66 g of $NiSO_4.6H_2O$ in 1 liter of water.

Potassium bromide, 0.5 *M*, 0.5 *N*. Dissolve 60 g of KBr in 1 liter of water.

Potassium carbonate, 1.5 *M*, 3 *N*. Dissolve 207 g of K_2CO_3 in 1 liter of water.

Potassium chloride, 0.5 *M*, 0.5 *N*. Dissolve 37 g of KCl in 1 liter of water.

Potassium chromate, 0.25 *M*, 0.5 *N*. Dissolve 49 g of K_2CrO_4 in 1 liter of water.

Potassium cyanide, 0.5 *M*, 0.5 *N*. Dissolve 33 g of KCN in 1 liter of water.

Potassium dichromate, 0.125 *M*. Dissolve 37 g of $K_2Cr_2O_7$ in 1 liter of water.

Potassium ferricyanide, 0.167 *M*, 0.5 *N*. Dissolve 55 g of $K_3Fe(CN)_6$ in 1 liter of water.

Potassium ferrocyanide, 0.5 *M*, 2 *N*. Dissolve 211 g of $K_4Fe(CN)_6.3H_2O$ in water. Dilute to 1 liter.

Potassium iodide, 0.5 *M*, 0.5 *N*. Dissolve 83 g of KI in 1 liter of water.

Potassium nitrate, 0.5 *M*, 0.5 *N*. Dissolve 51 g of KNO_3 in 1 liter of water.

Potassium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 44 g of K_2SO_4 in 1 liter of water.

Silver nitrate, 0.5 *M*, 0.5 *N*. Dissolve 85 g of $AgNO_3$ in water. Dilute to 1 liter.

Sodium acetate, 3 *M*, 3 *N*. Dissolve 408 g of $NaC_2H_3O_2 \cdot 3H_2O$ in water. Dilute to 1 liter.

Sodium carbonate, 1.5 *M*, 3 *N*. Dissolve 159 g of Na_2CO_3, or 430 g of $Na_2CO_3.10H_2O$ in water. Dilute to 1 liter.

Sodium chloride, 0.5 *M*, 0.5 *N*. Dissolve 29 g of NaCl in 1 liter of water.

Sodium cobaltinitrite, 0.08 *M* (reagent for potassium). Dissolve 25 g of $NaNO_2$ in 75 ml of water, add 2 ml of glacial acetic acid and then 2.5 g of $Co(NO_3)_2.6H_2O$. Allow to stand for several days, filter and dilute to 100 ml. Reagent is somewhat unstable.

Sodium hydrogen phosphate, 0.167 *M*, 0.5 *N*. Dissolve 60 g of $Na_2HPO_4.12H_2O$ in 1 liter of water.

Sodium nitrate, 0.5 *M*, 0.5 *N*. Dissolve 43 g of $NaNO_2$ in 1 liter of water.

Sodium sulfate, 0.25 *M*, 0.5 *N*. Dissolve 36 g of Na_2SO_4 in 1 liter of water.

Sodium sulfide, 0.5 *M*, 1 *N*. Dissolve 120 g of $Na_2S.9H_2O$ in water and dilute to 1 liter. Or, saturate 500 ml of 1 *M* NaOH (21 g of 95% NaOH sticks) with H_2S, keeping the solution cool, and dilute with 500 ml of 1 *M* NaOH.

Stannic chloride, 0.125 *M*, 0.5 *N*. Dissolve 33 g of $SnCl_4$ in 1 liter of water.

Stannous chloride, 0.5 *M*, 1 *N*. Dissolve 113 g of $SnCl_2.2H_2O$ in 170 ml of conc. HCl, using heat if necessary. Dilute with water to 1 liter. Add a few pieces of tin foil. Prepare solution fresh at frequent intervals.

Stannous chloride (for Bettendorf test). Dissolve 113 g of $SnCl_2.2H_2O$ in 75 ml of conc. HCl. Add a few pieces of tin foil.

Strontium chloride, 0.25 *M*, 0.5 *N*. Dissolve 67 g of $SrCl_2.6H_2O$ in 1 liter of water.

Zinc nitrate, 0.25 *M*, 0.5 *N*. Dissolve 74 g of $Zn(NO_3)_2.6H_2O$ in 1 liter of water.

Zinc sulfate, 0.25 *M*, 0.5 *N*. Dissolve 72 g of $ZnSO_4.7H_2O$ in 1 liter of water.

SPECIAL SOLUTIONS AND REAGENTS

Aluminon (qualitative test for aluminum). Aluminon is a trade name for the ammonium salt of aurin tricarboxylic acid. Dissolve 1 g of the salt in 1 liter of distilled water. Shake the solution well to insure thorough mixing.

Bang's reagent (for glucose estimation). Dissolve 100 g of K_2CO_3, 66 g of KCl and 160 g of $KHCO_3$ in the order given in about 700 ml of water at 30° C. Add 4.4 g of $CuSO_4$ and dilute to 1 liter after the CO_2 is evolved. This solution should be shaken only in such a manner as not to allow entry of air. After 24 hours 300 ml are diluted to 1 liter with saturated KCl solution, shaken gently and used after 24 hours; 50 ml equivalent to 10 mg glucose.

Barfoed's reagent (test for glucose). See *Cupric acetate*.

Baudisch's reagent. See *Cupferron*.

Benedict's solution (qualitative reagent for glucose). With the aid of heat, dissolve 173 g of sodium citrate and 100 g of Na_2CO_3 in 800 ml of water. Filter, if necessary, and dilute to 850 ml. Dissolve 17.3 g of $CuSO_4.5H_2O$ in 100 ml of water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution, and make up to 1 liter.

Benzidine hydrochloride solution (for sulfate determination). Make a paste of 8 g of benzidine hydrochloride ($C_{12}H_8(NH_2)_2.2HCl$) and 20 ml of water, add 20 ml of HCl (sp. gr. 1.12) and dilute to 1 liter with water. Each ml of this solution is equivalent to 0.00357 g of H_2SO_4.

Bertrand's reagent (glucose estimation). Consists of the following solutions:

(a) Dissolve 200 g of Rochelle salts and 150 g of NaOH in sufficient water to make 1 liter of solution.

(b) Dissolve 40 g of $CuSO_4$ in enough water to make 1 liter of solution.

(c) Dissolve 50 g of $Fe_2(SO_4)_3$ and 200 g of H_2SO_4 (sp. gr. 1.84) in sufficient water to make 1 liter of solution.

(d) Dissolve 5 g of $KMnO_4$ in sufficient water to make 1 liter of solution.

Bial's reagent (for pentose). Dissolve 1 g of orcinol ($CH_3.C_6H_3(OH)_2$) in 500 ml of 30% HCl to which 30 drops of a 10% solution of $FeCl_3$ has been added.

Boutron-Boudet soap solution.

(a) Dissolve 100 g of pure castile soap in about 2500 ml of 56% ethyl alcohol.

(b) Dissolve 0.59 g of $Ba(NO_3)_2$ in 1 liter of water.

Adjust the castile soap solution so that 2.4 ml of it will give a permanent lather with 40 ml of solution (b). When adjusted, 2.4 ml of soap solution is equivalent to 220 parts per million of hardness (as $CaCO_3$) for a 40 ml sample.

See also *Soap solution*.

Brucke's reagent (protein precipitation). See *Potassium iodide-mercuric iodide*.

Clarke's soap solution (or A.P.H.A. standard method). Estimation of hardness in water.

(a) Dissolve 100 g of pure powdered castile soap in 1 liter of 80% ethyl alcohol and allow to stand over night.

(b) Prepare a standard solution of $CaCl_2$ by dissolving 0.5 g of $CaCO_3$ in HCl (sp. gr. 1.19), neutralize with NH_4OH and make slightly alkaline to litmus, and dilute to 500 ml. One ml is equivalent to 1 mg of $CaCO_3$.

Titrate (a) against (b) and dilute (a) with 80% ethyl alcohol until 1 ml of the resulting solution is equivalent to 1 ml of (b) after making allowance for the lather factor (the amount of standard soap solution required to produce a permanent lather in 50 ml of distilled water). One ml of the adjusted solution after subtracting the lather factor is equivalent to 1 mg of $CaCO_3$.

See also *Soap solution*.

Cobalticyanide paper (Rinnmann's test for Zn). Dissolve 4 g of $K_3Co(CN)_6$ and 1 g of $KClO_3$ in 100 ml of water. Soak filter paper in solution and dry at 100° C. Apply drop of zinc solution and burn in an evaporating dish. A green disk is obtained if zinc is present.

Cochineal. Extract 1 g of cochineal for four days with 20 ml of alcohol and 60 ml of distilled water. Filter.

Congo red. Dissolve 0.5 g of congo red in 90 ml of distilled water and 10 ml of alcohol.

Cupferron (Baudisch's reagent for iron analysis). Dissolve 6 g of the ammonium salt of nitroso-phenyl-hydroxylamine (cupferron) in 100 ml of H_2O. Reagent good for one week only and must be kept in the dark.

Cupric acetate (Barfoed's reagent for reducing monosaccharides). Dissolve 66 g of cupric acetate and 10 ml of glacial acetic acid in water and dilute to 1 liter.

Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen and silk, but not wool).

1. Dissolve 5 g of cupric sulfate in 100 ml of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimum quantity of ammonium hydroxide.

2. Bubble a slow stream of air through 300 ml of strong ammonium hydroxide containing 50 g of fine copper turnings. Continue for one hour.

Cupric sulfate in glycerin-potassium hydroxide (reagent for silk). Dissolve 10 g of cupric sulfate, $CuSO_4.5H_2O$, in 100 ml of water and add 5 g of glycerin. Add KOH solution slowly until a deep blue solution is obtained.

Cupron (benzoin oxime). Dissolve 5 g in 100 ml of 95% alcohol.

Cuprous chloride, acidic (reagent for CO in gas analysis).

1. Cover the bottom of a two-liter flask with a layer of cupric oxide about one-half inch deep, suspend a bunch of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid (sp. gr. 1.10). Shake occasionally. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute hydrochloric acid until either the cupric oxide or the copper wire is used up.

Copper sulfate may be substituted for copper oxide in the above procedure.

2. Dissolve 340 g of $CuCl_2.2H_2O$ in 600 ml of conc. HCl and reduce the cupric chloride by adding 190 ml of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 ml flask with conc. HCl until no more tin goes into solution.

3. (Winkler method). Add a mixture of 86 g of CuO and 17 g of finely divided metallic Cu, made by the reduction of CuO with hydrogen, to a solution of HCl, made by diluting 650 ml of conc. HCl with 325 ml of water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. Shake occasionally, and when the solution becomes colorless, it is ready for use.

Cuprous chloride, ammoniacal (reagent for CO in gas analysis).

1. The acid solution of cuprous chloride as prepared above is neutralized with ammonium hydroxide until an ammonia odor persists. An excess of metallic copper must be kept in the solution.

2. Pour 800 ml of acidic cuprous chloride, prepared by the Winkler method, into about 4 liters of water. Transfer the

precipitate to a 250 ml graduate. After several hours, siphon off the liquid above the 50 ml mark and refill with 7.5 % NH_4OH solution which may be prepared by diluting 50 ml of conc. NH_4OH with 150 ml of water. The solution is well shaken and allowed to stand for several hours. It should have a faint odor of ammonia.

Dichlorofluorescein indicator. Dissolve 1 g in 1 liter of 70 % alcohol or 1 g of the sodium salt in 1 liter of water.

Dimethylglyoxime (diacetyl dioxime), 0.01 *N*. Dissolve 0.6 g of dimethylglyoxime, $(CH_3CNOH)_2$, in 500 ml of 95 % ethyl alcohol. This is an especially sensitive test for nickel, a very definite crimson color being produced.

Diphenylamine (reagent for rayon). Dissolve 0.2 g in 100 ml of concentrated sulfuric acid.

Diphenylamine sulfonate (for titration of iron with $K_2Cr_2O_7$). Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 ml of water, add 0.5 g of sodium sulfate and filter off the precipitate of $BaSO_4$.

Diphenylcarbazide. Dissolve 0.2 g of diphenylcarbazide in 10 ml of glacial acetic acid and dilute to 100 ml with 95 % ethyl alcohol.

Esbach's reagent (estimation of protein). To a water solution of 10 g of picric acid and 20 g of citric acid, add sufficient water to make one liter of solution.

Eschka's compound. Two parts of calcined ("light") magnesia are thoroughly mixed with one part of anhydrous sodium carbonate.

Fehling's solution (reagent for reducing sugars).

(a) Copper sulfate solution. Dissolve 34.66 g of $CuSO_4.5H_2O$ in water and dilute to 500 ml.

(b) Alkaline tartrate solution. Dissolve 173 g of potassium sodium tartrate (Rochelle salts, $KNaC_4H_4O_6.4H_2O$) and 50 g of NaOH in water and dilute when cold to 500 ml.

For use, mix equal volumes of the two solutions at the time of using.

Ferric-alum indicator. Dissolve 140 g of ferric-ammonium sulfate crystals in 400 ml of hot water. When cool, filter, and make up to a volume of 500 ml with dilute (6 *N*) nitric acid.

Folin's mixture (for uric acid). To 650 ml of water add 500 g of $(NH_4)_2SO_4$, 5 g of uranium acetate and 6 g of glacial acetic acid. Dilute to 1 liter.

Formaldehyde-sulfuric acid (Marquis' reagent for alkaloids). Add 10 ml of formaldehyde solution to 50 ml of sulfuric acid.

Froehde's reagent. See *Sulfomolybdic acid.*

Fuchsin (reagent for linen). Dissolve 1 g of fuchsin in 100 ml of alcohol.

Fuchsin-sulfurous acid (Schiff's reagent for aldehydes). Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 ml of water, and add 10 ml of HCl. Keep in well-stoppered bottles and protect from light.

Gunzberg's reagent (detection of HCl in gastric juice). Prepare as needed a solution containing 4 g of phloroglucinol and 2 g of vanillin in 100 ml of absolute ethyl alcohol.

Hager's reagent. See *Picric acid.*

Hanus solution (for iodine number). Dissolve 13.2 g of resublimed iodine in one liter of glacial acetic acid which will pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, determined by titration (3 ml is about the proper amount). The iodine may be dissolved by the aid of heat, but the solution should be cold when the bromine is added.

Iodine, tincture of. To 50 ml of water add 70 g of I_2 and 50 g of KI. Dilute to 1 liter with alcohol.

Iodo-potassium iodide (Wagner's reagent for alkaloids). Dissolve 2 g of iodine and 6 g of KI in 100 ml of water.

Litmus (indicator). Extract litmus powder three times with boiling alcohol, each treatment consuming an hour. Reject the alcoholic extract. Treat residue with an equal weight of cold water and filter; then exhaust with five times its weight of boiling water, cool and filter. Combine the aqueous extracts.

Magnesia mixture (reagent for phosphates and arsenates). Dissolve 55 g of magnesium chloride and 105 g of ammonium chloride in water, barely acidify with hydrochloric acid, and dilute to 1 liter. The ammonium hydroxide may be omitted until just previous to use. The reagent, if completely mixed and stored for any period of time, becomes turbid.

Magnesium reagent. See *S and O reagent.*

Magnesium uranyl acetate. Dissolve 100 g of $UO_2(C_2H_3O_2)_2.2H_2O$ in 60 ml of glacial acetic acid and dilute to 500 ml. Dissolve 330 g of $Mg(C_2H_3O_2)_2.4H_2O$ in 60 ml of glacial acetic acid and dilute to 200 ml. Heat solutions to the boiling point until clear, pour the magnesium solution into the uranyl solution, cool and dilute to 1 liter. Let stand over night and filter if necessary.

Marme's reagent. See *Potassium-cadmium iodide.*

Marquis' reagent. See *Formaldehyde-sulfuric acid.*

Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions). Dissolve 1.358 g of $HgCl_2$ in 60 ml of water and pour into a solution of 5 g of KI in 10 ml of H_2O. Add sufficient water to make 100 ml.

Methyl orange indicator. Dissolve 1 g of methyl orange in 1 liter of water. Filter, if necessary.

Methyl orange, modified. Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF in 1 liter of 50% alcohol.

Methyl red indicator. Dissolve 1 g of methyl red in 600 ml of alcohol and dilute with 400 ml of water.

Methyl red, modified. Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF in 1 liter of 90% alcohol. Or, dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 liter of 90% alcohol.

Millon's reagent (for albumins and phenols). Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of water and decant the clear solution after several hours.

Mixed indicator. Prepared by adding about 1.4 g of xylene cyanole FF to 1 g of methyl orange. The dye is seldom pure enough for these proportions to be satisfactory. Each new lot of dye should be tested by adding additional amounts of the dye until a test portion gives the proper color change. The acid color of this indicator is like that of permanganate; the neutral color is gray; and the alkaline color is green. Described by Hickman and Linstead, J. Chem. Soc. (Lon.), **121,** 2502 (1922).

Molisch's reagent. See *α-Naphthol.*

α-Naphthol (Molisch's reagent for wool). Dissolve 15 g of α-naphthol in 100 ml of alcohol or chloroform.

Nessler's reagent (for ammonia). Dissolve 50 g of KI in the smallest possible quantity of cold water (50 ml). Add a saturated solution of mercuric chloride (about 22 g in 350 ml of water will be needed) until an excess is indicated by the formation of a precipitate. Then add 200 ml of 5 *N* NaOH and dilute to 1 liter. Let settle, and draw off the clear liquid.

Nickel oxide, ammoniacal (reagent for silk). Dissolve 5 g of nickel sulfate in 100 ml of water, and add sodium hydroxide solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 ml of concentrated ammonium hydroxide and 25 ml of water.

***p*-Nitrobenzene-azo-resorcinol** (reagent for magnesium). Dissolve 1 g of the dye in 10 ml of *N* NaOH and dilute to 1 liter.

Nitron (detection of nitrate radical). Dissolve 10 g of nitron ($C_{20}H_{16}N_4$, 4, 5-dihydro-1, 4-diphenyl-3, 5-phenylimino-1, 2, 4-triazole) in 5 ml of glacial acetic acid and 95 ml of water. The solution may be filtered with slight suction through an alundum crucible and kept in a dark bottle.

α-Nitroso-β-naphthol. Make a saturated solution in 50% acetic acid (1 part of glacial acetic acid with 1 part of water). Does not keep well.

Nylander's solution (carbohydrates). Dissolve 20 g of bismuth subnitrate and 40 g of Rochelle salts in 1 liter of 8% NaOH solution. Cool and filter.

Obermayer's reagent (for indoxyl in urine). Dissolve 4 g of $FeCl_3$ in one liter of HCl (sp. gr. 1.19).

Oxine. Dissolve 14 g of HC_9H_6ON in 30 ml of glacial acetic acid. Warm slightly, if necessary. Dilute to 1 liter.

Oxygen absorbent. Dissolve 300 g of ammonium chloride in one liter of water and add one liter of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, a bottle half full of copper turnings is filled nearly full with the NH_4Cl-NH_4OH solution and the gas passed through.

Pasteur's salt solution. To one liter of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate and 12.00 g of ammonium tartrate.

Pavy's solution (glucose reagent). To 120 ml of Fehling's solution, add 300 ml of NH_4OH (sp. gr. 0.88) and dilute to 1 liter with water.

Phenanthroline ferrous ion indicator. Dissolve 1.485 g of phenanthroline monohydrate in 100 ml of 0.025 *M* ferrous sulfate solution.

Phenolphthalein. Dissolve 1 g of phenolphthalein in 50 ml of alcohol and add 50 ml of water.

Phenolsulfonic acid (determination of nitrogen as nitrate). Dissolve 25 g of phenol in 150 ml of conc. H_2SO_4, add 75 ml of fuming H_2SO_4 (15% SO_3), stir well and heat for two hours at 100° C.

Phloroglucinol solution (pentosans). Make a 3% phloroglucinol solution in alcohol. Keep in a dark bottle.

Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).

1. Prepare ammonium phosphomolybdate and after washing with water, boil with nitric acid and expel NH_3; evaporate to dryness and dissolve in 2 *N* nitric acid.

2. Dissolve ammonium molybdate in HNO_3 and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia until the ammonium salt is decomposed. Evaporate to dryness. The residue dissolved in 10% HNO_3 constitutes Sonnenschein's reagent.

Phosphoric acid—sulfuric acid mixture. Dilute 150 ml of conc. H_2SO_4 and 100 ml of conc. H_3PO_4 (85%) with water to a volume of 1 liter.

Phosphotungstic acid (Scheibler's reagent for alkaloids).

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 ml of water containing a little nitric acid.

2. The reagent is a 10% solution of phosphotungstic acid in water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to effect solution. Crystals of phosphotungstic acid separate.

Picric acid (Hager's reagent for alkaloids, wool and silk). Dissolve 1 g of picric acid in 100 ml of water.

Potassium antimonate (reagent for sodium). Boil 22 g of potassium antimonate with 1 liter of water until nearly all of the salt has dissolved, cool quickly, and add 35 ml of 10% potassium hydroxide. Filter after standing over night.

Potassium-cadmium iodide (Marme's reagent for alkaloids). Add 2 g of CdI_2 to a boiling solution of 4 g of KI in 12 ml of water, and then mix with 12 ml of saturated KI solution.

Potassium hydroxide (for CO_2 absorption). Dissolve 360 g of KOH in water and dilute to 1 liter.

Potassium iodide-mercuric iodide (Brucke's reagent for proteins). Dissolve 50 g of KI in 500 ml of water, and saturate with mercuric iodide (about 120 g). Dilute to 1 liter.

Potassium pyrogallate (for oxygen absorption). For mixtures of gases containing less than 28% oxygen, add 100 ml of KOH solution (50 g of KOH to 100 ml of water) to 5 g of pyrogallol. For mixtures containing more than 28% oxygen the KOH solution should contain 120 g of KOH to 100 ml of water.

Pyrogallol, alkaline.

(a) Dissolve 75 g of pyrogallic acid in 75 ml of water.

(b) Dissolve 500 g of KOH in 250 ml of water. When cool, adjust until sp. gr. is 1.55.

For use, add 270 ml of solution (b) to 30 ml of solution (a).

Rosolic acid (indicator). Dissolve 1 g of rosolic acid in 10 ml of alcohol and add 100 ml of water.

S and O reagent (Suitsu and Okuma's test for Mg). Dissolve 0.5 g of the dye (*o*-*p*-dihydroxy-monazo-*p*-nitrobenzene) in 100 ml of 0.25 N NaOH.

Scheibler's reagent. See *Phosphotungstic acid.*

Schiff's reagent. See *Fuchsin-sulfurous acid.*

Schweitzer's reagent. See *Cupric oxide, ammoniacal.*

Soap solution (reagent for hardness in water). Dissolve 100 g of dry castile soap in 1 liter of 80% alcohol (5 parts alcohol to 1 part water). Allow to stand several days and dilute with 70% to 80% alcohol until 6.4 ml produces a permanent lather with 20 ml of standard calcium solution. The latter solution is made by dissolving 0.2 g of $CaCO_3$ in a small amount of dilute HCl, evaporating to dryness and making up to 1 liter.

Sodium bismuthate (oxidation of manganese). Heat 20 parts of NaOH nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth nitrate which has been previously dried. Add two parts of sodium peroxide, and pour the brownish-yellow fused mass on an iron plate to cool. When cold, break up in a mortar, extract with water, and collect on an asbestos filter.

Sodium hydroxide (for CO_2 absorption). Dissolve 330 g of NaOH in water and dilute to 1 liter.

Sodium nitroprusside (reagent for hydrogen sulfide and wool). Use a freshly prepared solution of 1 g of sodium nitroprusside in 10 ml of water.

Sodium oxalate, according to Sörensen (primary standard). Dissolve 30 g of the commercial salt in 1 liter of water, make slightly alkaline with sodium hydroxide, and let stand until perfectly clear. Filter and evaporate the filtrate to 100 ml. Cool and filter. Pulverize the residue and wash it several times with small volumes of water. The procedure is repeated until the mother liquor is free from sulfate and is neutral to phenolphthalein.

Sodium plumbite (reagent for wool). Dissolve 5 g of sodium hydroxide in 100 ml of water. Add 5 g of litharge and boil until dissolved.

Sodium polysulfide. Dissolve 480 g of $Na_2S.9H_2O$ in 500 ml of water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 liter with water.

Sonnenschein's reagent. See *Phosphomolybdic acid.*

Starch solution.

1. Make a paste with 2 g of soluble starch and 0.01 g of HgI_2 with a small amount of water. Add the mixture slowly to 1 liter of boiling water and boil for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not clear on boiling; it should be allowed to stand and the clear liquid decanted.

2. A solution of starch which keeps indefinitely is made as follows: Mix 500 ml of saturated NaCl solution (filtered), 80 ml of glacial acetic acid, 20 ml of water and 3 g of starch. Bring slowly to a boil and boil for two minutes.

3. Make a paste with 1 g of soluble starch and 5 mg of HgI_2, using as little cold water as possible. Then pour about 200 ml of boiling water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water actually boiling. Cool and add 4 g of KI. Starch solution decomposes on standing due to bacterial action, but this solution will keep a long time if stored under a layer of toluene.

Stoke's reagent. Dissolve 30 g of $FeSO_4$ and 20 g of tartaric acid in water and dilute to 1 liter. Just before using, add concentrated NH_4OH until the precipitate first formed is redissolved.

Sulfanilic acid (reagent for nitrites). Dissolve 0.5 g of sulfanilic acid in a mixture of 15 ml of glacial acetic acid and 135 ml of recently boiled water.

Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides). Dissolve 10 g of molybdic acid or sodium molybdate in 100 ml of conc. H_2SO_4.

Tannic acid (reagent for albumen, alkaloids and gelatin). Dissolve 10 g of tannic acid in 10 ml of alcohol and dilute with water to 100 ml.

Titration mixture. See *Zimmermann-Reinhardt reagent.*

***o*-Tolidine solution** (residual chlorine in water analysis). Prepare 1 liter of dilute HCl (100 ml of HCl (sp. gr. 1.19) in sufficient water to make 1 liter). Dissolve 1 g of *o*-tolidine in 100 ml of the dilute HCl and dilute to 1 liter with dilute HCl solution.

Trinitrophenol solution. See *Picric acid.*

Turmeric paper. Impregnate white, unsized paper with the tincture, and dry.

Turmeric tincture (reagent for borates). Digest ground turmeric root with several quantities of water which are discarded. Dry the residue and digest it several days with six times its weight of alcohol. Filter.

Uffelmann's reagent (turns yellow in presence of a lactic acid). To a 2% solution of pure phenol in water, add a water solution of $FeCl_3$ until the phenol solution becomes violet in color.

Wagner's reagent. See *Iodo-potassium iodide.*

Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum). Dissolve 25 g of citric acid and 1 g of salicylic acid in water and dilute to 1 liter. Use 50 ml of the reagent.

Wij's iodine monochloride solution (for iodine number). Dissolve 13 g of resublimed iodine in 1 liter of glacial acetic acid which will pass the dichromate test for reducible matter. Set aside 25 ml of this solution. Pass into the remainder of the solution dry chlorine gas (dried and washed by passing through H_2SO_4 (sp. gr. 1.84)) until the characteristic color of free iodine has been discharged. Now add the iodine solution which was reserved, until all free chlorine has been destroyed. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid use of solutions which have been prepared for more than 30 days.

Wij's special solution (for iodine number—Analyst **58,** 523–7, 1933). To 200 ml of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloroamine T (paratoluene-sulfonedichloroamide), and 16.6 g of dry KI (in small quantities with continual shaking until all the KI has dissolved). Make up to 1 liter with the same quality of acetic acid used above and preserve in a dark colored bottle.

Zimmermann-Reinhardt reagent (determination of iron). Dissolve 70 g of $MnSO_4.4H_2O$ in 500 ml of water, add 125 ml of conc. H_2SO_4 and 125 ml of 85% H_3PO_4, and dilute to 1 liter.

Zinc chloride solution, basic (reagent for silk). Dissolve 1000 g of zinc chloride in 850 ml of water, and add 40 g of zinc oxide. Heat until solution is complete.

Zinc uranyl acetate (reagent for sodium). Dissolve 10 g of $UO_2(C_2H_3O_2)_2.2H_2O$ in 6 g of 30% acetic acid with heat, if necessary, and dilute to 50 ml. Dissolve 30 g of $Zn(C_2H_3O_2)_2.$-$2H_2O$ in 3 g of 30% acetic acid and dilute to 50 ml. Mix the two solutions, add 50 mg of NaCl, allow to stand over night and filter.

STANDARD SOLUTIONS FOR VOLUMETRIC ANALYSIS

Acids

Hydrochloric acid, normal. (36.465 g per liter) (a) 180.15 g of constant boiling point (760 mm) acid diluted to 1 liter gives an exactly normal solution. (b) Concentrated HCl diluted to d 1.020 is approximately normal. (c) Concentrated HCl contains about one-third of its weight of HCl and 120 g diluted with water to 1 liter will give an acid slightly greater than normal. Solutions prepared as in (b) or (c) are most accurately standardized by precipitation as AgCl.

Hydrochloric acid solutions, standard, by the method of G. A. Hulett and W. D. Bonner. *Jour. Am. Chem. Soc.* **31,** 390 (1909). Standard HCl is easily prepared by starting with HCl of about d 1.10, made up with an ordinary hydrometer, distilling off and discarding the first three-fourths of the liquid taken; the distillate which is then collected does not differ by more than one part in 10,000 from the values in the table below. This constant boiling acid is not hygroscopic or noticeably volatile and is easily weighed in a small flask. By the use of a capillary pipette, to adjust the last amount of acid, it is a very simple matter to weigh out 180.15 g to less than 10 mg and this furnishes sufficient acid to make a liter of normal solution with an accuracy that is seldom attained even with very elaborate precautions.

Constant Boiling Hydrochloric Acid

SOLUTIONS FOR VOLUMETRIC ANALYSIS (Continued)

Nitric acid, normal. (63.016 g per liter) Use a colorless acid, d 1.3 ±, free from chlorine and nitrous acid; a yellow color due to lower oxides of nitrogen is removed by adding about 2 volumes of water, boiling, cooling and then diluting to volume. 65 ml or 93 g of acid, d 1.42 diluted to 1 liter gives an acid slightly greater than normal. Standardize by titration with standard alkali.

Oxalic acid, normal. $H_2C_2O_4$ (63.023 g of $H_2C_2O_4.2H_2O$ or 45.008 g of $H_2C_2O_4$ per liter) Because of the uncertainty in the amount of water of crystallization, standards in dry climates cannot be prepared directly by dissolving a weighed quantity of acid. However, in a humid atmosphere finely ground oxalic acid crystals may be exposed to the air for a few hours, and brought to the proper composition. Unless this is done it is necessary to standardize the solution against alkali of known concentration using phenolphthalein as an indicator. Decinormal or less concentrated solutions are unstable and should be prepared fresh when needed; more concentrated solutions may deposit some of the acid when cooled to low temperatures but they are fairly stable at room temperature when protected from light.

Potassium acid phthalate, decinormal. ($KHC_8H_4O_4$, 10.207 g per 500 ml) This monobasic acid is recommended for the preparation of standard acid solutions, since it has a high equivalent weight, is anhydrous, stable, non-hygroscopic, and can be purchased with a purity factor of 99.95 %. Spread 10–11 g of the salt in a thin layer on a watch glass and dry at 110–120° C in an electric oven for 2-3 hours. Cool in a desiccator and weigh to the nearest milligram. Transfer the salt to a 500 ml volumetric flask, with aid of a funnel, and reweigh the watch glass with any adhering powder. Dissolve the salt in the flask, dilute to volume, and mix thoroughly. Compute the normality of the solution by the equation

$$\text{Normality} = \frac{\text{Weight of salt} \times \text{purity}}{102.07}$$

Potassium acid phthalate is suitable for the titration of carbonate-free strong bases, using phenolphthalein indicator, but is not suitable for titration of ammonium hydroxide.

Succinic acid, decinormal. $H_2C_4H_4O_4$ (5.9023 g per liter) Dry 5–6 g of pure succinic acid in an open weighing bottle at 105° for about 10 hours; cool in a desiccator. Weigh out accurately 2.9512 g, brush into a 400 ml beaker and dissolve in 150–200 ml of water; pour the solution into a 500 ml graduated flask, rinsing out the beaker several times to insure complete transference of the acid. Dilute to exactly 500 ml and mix thoroughly. This prepares an exact decinormal solution.

Sulfuric acid, normal. (49.04 g per liter) Take 30 ml of pure, concentrated H_2SO_4, d 1.84 and pour it cautiously and slowly into about 3–4 volumes of water, cool, mix thoroughly and dilute to 1 liter. Standardize by titration with standard

NaOH or KOH solutions with phenolphthalein as indicator. For a decinormal solution use 3 ml H_2SO_4 per liter and proceed as above. Sulfuric acid is obtained easily in a pure form; the normal acid solution is not affected by boiling (advantage over similar HNO_3 or HCl solutions); when used with lime or similar compounds, it gives precipitates and for such cases HCl is preferable.

Bases

For the titration of weak acids, bases should be made free of carbonate and used with phenolphthalein indicator. Such solutions should be stored in siphon-equipped bottles and protected from carbon dioxide by a soda-lime tube on the air inlet. The burette used for the titration should be capped by a one-hole stopper bearing a small tube of soda lime. If a base is to be used only for the titration of strong acids, it is unnecessary to remove carbonate or to protect the solution from carbon dioxide, since absorption of the latter does not change the alkaline value of the solution. Bases containing carbonate should be used with methyl orange indicator.

Potassium hydroxide, normal. (56.108 g per liter) Dissolve 64 g of potassium hydroxide, of assay value 85 % or better, in water and dilute to 1 liter. Standardize as directed for sodium hydroxide.

Sodium hydroxide, decinormal. Carbonate free. Prepare the carbonate free solution by one of the following methods:

1. Dissolve 6 g of sodium hydroxide in 200 ml of water. heat to boiling, and slowly add to the boiling solution 5 ml of 5 % barium chloride solution. Allow the precipitate to settle, add a few drops of barium chloride solution and notice whether a fresh precipitate forms. If more precipitate is formed, add another 5 ml of the reagent, and again test for completeness of precipitation of carbonate. Continue in this manner until no further precipitate forms. Allow the precipitate to settle, decant off two-thirds of the clear solution, and dilute to 1 liter with freshly boiled water. Standardize by titrating weighed 0.6–0.8 g portions of dry potassium acid phthalate, dissolved in 100 ml of water. Use phenolphthalein indicator.

2. (Recommended method) Dissolve 7 g of sodium hydroxide in 7 ml of water and filter the viscous liquid through an asbestos mat in a Gooch crucible, with aid of suction. Catch the filtrate in a small dry test tube. Do not wash the residue. Pour off two-thirds of the clear filtrate and dilute to 1 liter with freshly boiled water.

3. Place within an empty vacuum desiccator a beaker of water and a dry beaker containing 2.3 g of sodium metal, cut into thin shavings. The sodium must be clean and free of oil. Connect the desiccator to a water aspirator pump and evacuate. In the atmosphere of water vapor thus formed, the sodium metal quickly reacts to form sodium hydroxide. Continue to evacuate the desiccator until all the metal has dissolved and a

clear solution remains in the beaker. Dilute all this solution to 1 liter with freshly boiled water.

Sodium hydroxide, normal. (40.005 g per liter) Dissolve 42 g of sodium hydroxide sticks or pellets, of assay value 95% or better, in water and dilute to 1 liter. Standardize with normal hydrochloric acid or sulfuric acid, using methyl orange indicator.

Oxidizing and Reducing Solutions

Arsenite, alkaline, decinormal. $As^{III} \rightarrow As^{V}$ (4.9465 g As_2O_3 per liter; equivalent to 0.0126932 g I or 0.0035457 g Cl per ml) Dissolve 4.9465 g of pure sublimed As_2O_3 in a concentrated solution of 4 g of NaOH, add 100 ml of a saturated $NaHCO_3$ solution and dilute to 1 liter. Do not warm the solution above 60° C when dissolving the As_2O_3. Standardize against standard iodine solution with a starch indicator.

Ceric sulfate (oxidizing agent). Ceric sulfate is a strong oxidizing agent in acid solutions, is stable over a long period, can be used to titrate reducing agents in the presence of HCl and has only one valence change from 4 to 3. It can be used as a volumetric reagent in acid medium only since perceric compounds are formed in an alkaline medium. It cannot be used as its own indicator if the solution is colored.

1. The solution is made up for use by adding 64–66 g of ceric ammonium sulfate, $Ce(SO_4)_2.2(NH_4)_2SO_4.2H_2O$ or 35–40 g of ceric sulfate, $Ce(SO_4)_2$, to a solution of 500 ml of H_2O and 28 ml of concentrated H_2SO_4. The solution should be stirred until all is dissolved and 500 ml more of distilled water added.

2. Alternative method. To 35 g of ceric oxide in a 600 ml beaker, add 46 ml of concentrated H_2SO_4. Carefully add 50 ml of water and heat at boiling for five minutes. Cool somewhat and add, carefully, 450 ml of water. Digest until solution is complete. Filter, if necessary, dilute to 1000 ml and standardize.

The solution can be standardized against arsenious oxide dissolved in NaOH and acidified with H_2SO_4; against sodium oxalate or electrolytic iron by the Zimmermann-Reinhardt Method, using sodium diphenylamine sulfonate as indicator. The indicator acid is tri-ortho-phenanthroline ferrous sulfate, $(C_{12}H_8N_2.H_2O)FeSO_4$. The reaction involved in the standardization with sodium oxalate is $H_2C_2O_4 + 2Ce(SO_4)_2 = 2CO_2 + Ce_2(SO_4)_3 + H_2SO_4$.

An amount of sodium oxalate is weighed out which will require 25–35 ml of 0.1 N ceric sulfate solution for titration. To this is added 10–20 ml of concentrated HCl, 5 ml of 0.005 M iodine chloride and enough water to make a volume of 100 ml. The solution should be heated to 50° C, 1 drop of indicator added, and the solution titrated with ceric sulfate until the solution becomes pale blue in color and there is no return of any pink color after one minute. The temperature should not fall below 45° C.

Ceric sulfate may be used to titrate ferrous chloride according

to the reaction: $2FeCl_2 + 2Ce(SO_4)_2 + 2HCl = 2FeCl_3 + Ce_2(SO_4)_3 + H_2SO_4$.

Calcium may be precipitated as the oxalate, dissolved in dilute HCl and titrated with ceric sulfate. Chromium, arsenic, ferrocyanide and hydrogen peroxide may be titrated with ceric sulfate.

Iodine, decinormal. $I_2 \rightarrow 2HI$ (12.6932 g per liter) Dissolve about 13.5 g of pure sublimed iodine in a solution of 24 g of KI in 200 ml of H_2O and dilute to 1 liter. The solution is standardized by adding the iodine to a known volume of standard thiosulfate with a few drops of starch solution for the indicator.

Potassium dichromate, decinormal. $Cr^{vi} \rightarrow Cr^{iii}$ (4.904 g per liter) Grind about 5 g of potassium dichromate, of the purest grade obtainable, spread in a thin layer on a watch glass, and dry in an electric oven at 120–140° C for 2–4 hours. Cool in a desiccator and weigh to the nearest milligram. Transfer the powder to a 1 liter volumetric flask, with the aid of a funnel, and reweigh the watch glass with any adhering powder. Add water to the flask, shake until the sample is dissolved, dilute to volume and mix thoroughly. Compute the normality from the equation

$$\text{Normality} = \frac{\text{Weight potassium dichromate}}{49.04}$$

If pure dichromate is not available the solution may be standardized by iron wire or against an iron ore of known analysis. Weigh out three 0.2 g samples of clean, bright iron wire (prepared "for standardization", with purity factor of 99.8%) and transfer each to a 500 ml Erlenmeyer flask. Dissolve the wire in 10 ml of concentrated hydrochloric acid, keeping the flask covered with a small watch glass until solution is complete. Disregard a small residue of carbon which may remain in the solution as black particles. Rinse off the watch glass, heat the solution nearly to boiling and add stannous chloride solution (5 g of salt dissolved in 10 ml of concentrated hydrochloric acid, and diluted to 100 ml) a drop at a time until the solution is colorless. *Avoid an excess of over one drop of stannous chloride.* Cool completely and pour in 10 ml of saturated mercuric chloride solution. Allow to stand 2 minutes, then add a well cooled solution of 5 ml of 85% phosphoric acid in 200 ml of 3 *N* sulfuric acid (8:100). Add 6–8 drops of an indicator solution (containing 3 g of the sodium or barium salt of diphenylamine sulfonic acid per liter) and titrate with dichromate solution to the first appearance of a purple or violet tinge. The titration should be made slowly, since the reaction proceeds rather slowly. Run a blank. From the net volume of dichromate, compute the normality by the equation

$$\text{Normality} = \frac{\text{Weight of iron wire} \times \text{purity of iron}}{\text{Volume of dichromate} \times 0.05584}$$

Potassium permanganate, decinormal. $Mn^{vii} \rightarrow Mn^{ii}$ (3.1606 g per liter) Dissolve 3.3 g of dry $KMnO_4$ in 1 liter of

distilled water and allow to stand at least 24 hours in a clean glass-stoppered bottle. The reasons for not using the freshly prepared solution are: 1st, the reducing agents in the water (dust, etc.) are thus all oxidized, and 2nd, any MnO_2 formed by this reduction is permitted to settle. The solution is then carefully siphoned through a clean glass tube into clean beakers, discarding the first 25 ml of solution and the last inch of the solution in the bottle which contains the precipitated MnO_2; the $KMnO_4$ solution should never be permitted to come in contact with rubber, filter paper or other organic matter. The solution in the beakers is now poured back into a clean bottle and standardized against sodium oxalate. Weigh out several 0.25–0.30 g samples of sodium oxalate having an assay value of 99.95 %, transfer each portion to a 600 ml beaker, and dissolve in 250 ml of dilute sulfuric acid (5:95). Stir until the oxalate has dissolved, then add rapidly* from a burette about 95 % of the amount of permanganate needed for complete oxidation of the sample (a preliminary titration is made with one sample to determine the approximate amount of permanganate needed). Allow the solution to stand until the permanganate is decolorized, then heat to 55–60° C and complete the titration at this temperature, stirring *gently* with a thermometer and allowing each drop to become decolorized before adding the next. The end point is shown by a faint pink tinge which persists for 30 seconds. Run a blank on 250 ml of dilute sulfuric acid, heated to 60° C. From the net volume of permanganate, compute the normality by the equation

$$\text{Normality} = \frac{\text{Weight sodium oxalate} \times \text{purity}}{\text{Volume permanganate} \times 0.067}$$

Sodium thiosulfate, decinormal. $2Na_2S_2O_3 \rightarrow Na_2S_4O_6$ (24.8192 g of $Na_2S_2O_3.5H_2O$ per liter) Do not dry the sodium thiosulfate in an oven as it can be obtained almost pure; weigh out 25.0 g and dilute to exactly 1 liter. After mixing thoroughly, the solution is allowed to stand two weeks. If free sulfur has separated, the clear liquid is siphoned off. The solution is standardized indirectly by titration with potassium dichromate (see above). Dissolve 5 g of KI and 4 g of $NaHCO_3$ in 300 ml of H_2O in a 500 ml Erlenmeyer flask at room temperature and then add HCl slowly, swirling the flask, until there is no more evolution of CO_2 and then add about 10 ml more acid; add 35 ml of 0.1 N $K_2Cr_2O_7$, mixing the solutions, rinse the sides of the flask with a few ml of water, allowing it to form a layer over the solution without mixing; stopper the flask and allow to stand about 10 minutes. Then with thorough mixing run in thiosulfate until the solution is a light yellow, add a few drops of starch solution and continue with a slow addition of thiosulfate until the bright blue color has disappeared and only the pale green color of $CrCl_3$ remains.

* The method given for standardization is based upon the directions of Fowler and Bright, Bur. Stand. J. Res., **15**, 493 (1935).

REAGENTS FOR SEMI-MICRO QUALITATIVE ANALYSIS

Compiled by D. W. Pearce

The following reagents have been found extremely sensitive as confirmatory tests for the ions indicated. In most cases separation from other ions by micro or semi-micro technique should precede the test. For interferences, references to original literature, and detailed procedures see Feigl, "Qualitativ Analyse mit Hilfe von Tupfelreactionen", or Engelder, Dunkelberger and Schiller, "Semi-Micro Qualitative Analysis". Also see table, *Organic Analytical Reagents*, for other reagents.

Ammonium molybdate. Dissolve 15 g of ammonium molybdate in 300 ml of water, add 100 ml of nitric acid (1:2) and saturate with ammonium nitrate. Fine yellow precipitate for $H_2PO_4^-$ (cold) or $H_2AsO_4^-$ (60° C) in nitric acid solution.

Aniline sulfate. Concentrated solution of aniline sulfate in concentrated sulfuric acid. Reagent gives instant blue color with ClO_3^-; other strong oxidants as NO_3^- give the blue color much more slowly.

Benzidine acetate—cupric acetate. (a) Dilute 47.5 ml of saturated benzidene acetate solution to 100 ml. (b) Dissolve 0.286 g of cupric acetate in 100 ml solution. Solution (a) + solution (b) on spot paper gives blue color with HCN vapors.

α-Benzoinoxime. 5% alcoholic solution. Green precipitate with Cu^{++} in slightly ammoniacal solution.

Bettendorf's reagent. Saturated solution of $SnCl_2$ in concentrated HCl. Brown color or black precipitate upon adding As^{+3} (immediate) or As^{+5} (on standing), to excess of the reagent.

Brucine reagent. 0.02 g of brucine dissolved in 100 ml of concentrated sulfuric acid. Test solution + concentrated sulfuric acid + brucine reagent gives fleeting red color with NO_3^-, NO_2^-, or ClO_3^-.

Cacothelin. Fresh, saturated aqueous solution of cacothelin. Use a drop of reagent on test paper, warm till only slightly damp; drop of Sn^{+2} (reduced by means of Mg powder) gives violet color. Antimony does not interfere.

Cinchonin—potassium iodide reagent. One gram of cinchonin is dissolved in 100 ml of water upon the addition of a few drops of HNO_3 and warming; add 2 g of KI. Bright red-orange precipitate with Bi^{+++}, brown with Cu^{++}, yellow with Pb^{++}, white with Cd^{++}, and cream with Hg^{++}, in slightly acid solution.

Cobalticyanide paper (Rinnmann's green test). Saturate quantitative filter paper in a solution of 4 g of $K_3Co(CN)_6$ and 1 g of $KClO_3$ in 100 ml of water. Dry. Add drop test solution and ash the paper in a crucible over flame. Green ash—presence of Zn^{++}.

***p*-Dimethylaminobenzylidenerhodanine.** Saturated solution of the crystals in acetone. (Dissolve equi-molecular

amounts of rhodamine and *p*-dimethylaminobenzaldehyde in glacial acetic acid, warm on steam bath. Product may be crystallized out on addition of water.) Reagent for detection of Ag^{+} (and Hg^{++}) in nitric acid solution. Red-violet precipitate.

Dimethylglyoxime. 1 g dissolved in 100 ml of alcohol. In presence of much Co^{++} first add slight excess NaCN, warm till decidedly orange, add reagent and $AgNO_3$. Pink to red precipitate—presence of Ni^{++}.

Diphenylcarbazide. 1% alcoholic solution, freshly prepared. Violet or blue precipitate in neutral or slightly acid solution of $Hg(NO_3)_2$.

α-Nitrobenzeneazoresorcinol. 0.001 g dissolved in 100 ml of 2 *N* NaOH. Sky blue precipitate with Mg^{++}.

Potassium thiocyanate. Saturated aqueous solution. With HCl solution of CO^{++} yields deep blue color; best observed when extracted with amyl alcohol-ether (1:6). Fe^{+++}, if present, to be reduced with crystal of $Na_2S_2O_3$.

Rhodamine B. Dissolve 0.01 g of tetraethylrhodamine in 100 ml of water. Violet color with Sb^{+5} (oxidized with KNO_2 crystal). Tin does not interfere.

Sodium nitroprusside. Freshly prepared 1% aqueous solution. Deep violet color with S^{--} (alkaline).

Sulfanilic acid—α-naphthylamine. (a) 0.4 g of sulfanilic acid in 100 ml of 10% acetic acid. (b) 0.5 g of α-naphthylamine boiled in 100 ml of water; filter. Acetic acid + solution (a) + solution (b) gives brilliant red color with NO_2^-.

Tetramethyldiaminodiphenylmethane. Acetic acid solution. Blue color as sensitive test for Pb^{++}. (Must be previously oxidized to PbO_2 in ammonia solution with H_2O_2 and the latter decomposed by warming or standing.)

Zinc uranyl acetate. Dissolve 10 g of uranyl acetate, with warming, in 6 g of 30% acetic acid; dilute to 50 ml. Treat 30 g of zinc acetate with 3 g of 30% acetic acid; dilute to 50 ml. Mix the two solutions, add a trace of NaCl, let stand 24 hours and filter out the precipitate. Yellowish-green crystalline precipitate with Na^{+}.

Zirconium alizarin sulfonate reagent. (a) Dissolve 0.05 g of zirconium nitrate in 50 ml of H_2O and 10 ml of concentrated HCl. (b) Dissolve 0.05 g of alizarin red S in 50 ml of H_2O. Mix (a) and (b) to make the reagent. Gives immediate yellow color with F^- (oxalates or phosphates interfere, giving yellow color slowly).

ACID DILUTION BY VOLUME

The volume of pure acid (or water) which must be added to 50 cm³ of water (or acid) to give solutions of specific gravity shown. Temperature 20°C. Taken from curves prepared by W. W. Stiles, based on experimental determinations. The values are approximate only.

VOLUMETRIC PRIMARY STANDARDS

Compiled by John H. Yoe

The 1937 International atomic weights were used in computing the equivalent weights.

Primary standard	Formula	$\frac{\text{Eq wt}}{\text{mol. wt.}}$	Equivalent weight
A. Acidimetry			
s-Diphenylguanidine	$NH{\cdot}C[NHC_6H_5]_2$	1	211.25
Mercuric oxide	HgO	$\frac{1}{2}$	108.31
Potassium acid carbonate	$KHCO_3$	1	100.12
Potassium iodate	KIO_3	$\frac{1}{6}$	35.67
Sodium carbonate	Na_2CO_3	$\frac{1}{2}$	53.00
Sodium oxalate (1)	$Na_2C_2O_4$	$\frac{1}{2}$	67.01
Sodium tetraborate (borax)	$Na_2B_4O_7.10H_2O$	$\frac{1}{2}$	190.72
B. Alkalimetry			
Benzoic acid (1)	C_6H_5COOH	1	122.12
Hydrazine sulfate	$N_2H_4.H_2SO_4$	$\frac{1}{2}$	65.06
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.03
Potassium acid oxalate	KHC_2O_4	1	128.12
Potassium acid phthalate (1)	$KHC_8H_4O_4$	1	204.22
Potassium acid tartrate	$KHC_4H_4O_6$	1	188.18
Potassium tetraoxalate	$KH_3(C_2O_4)_2.2H_2O$	$\frac{1}{3}$	84.73
Sodium tetraborate (borax)	$Na_2B_4O_7.10H_2O$	$\frac{1}{2}$	190.72
C. Oxidimetry			
Ferrous sulfate (3)	$FeSO_4.7H_2O$	1	278.01
Ferrous ammonium sulfate (3)	$FeSO_4.(NH_4)_2SO_4.6H_2O$	1	392.14
Iron wire (4)	Fe	1	55.84
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.03
Potassium ferrocyanide	$K_4Fe(CN)_6.3H_2O$	1	422.38
Potassium iodate	KIO_3	$\frac{1}{2}$	107.01
Potassium iodide	KI	$\frac{1}{2}$	83.01
Silver	Ag	1	107.88
Sodium oxalate (1)	$Na_2C_2O_4$	$\frac{1}{2}$	67.01
D. Iodimetry			
Arsenious oxide (1)	As_2O_3	$\frac{1}{4}$	49.455
Copper	Cu	1	63.57
Hydrazine sulfate	$N_2H_4.H_2SO_4$	$\frac{1}{4}$	32.531
Iodine (resublimed) (5)	I	1	126.92
Iodine cyanide	ICN	$\frac{1}{2}$	76.464
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.03
Potassium bromate	$KBrO_3$	$\frac{1}{6}$	27.835
Potassium biiodate	$KH(IO_3)_2$	$\frac{1}{12}$	32.496
Potassium dichromate	$K_2Cr_2O_7$	$\frac{1}{6}$	49.035
Potassium ferricyanide	$K_3Fe(CN)_6$	1	329.24
Potassium iodate	KIO_3	$\frac{1}{6}$	35.669
Sodium thiosulfate	$Na_2S_2O_3.5H_2O$	1	248.19

VOLUMETRIC PRIMARY STANDARDS (Continued)

Primary standard	Formula	$\frac{\text{Eq wt}}{\text{mol. wt.}}$	Equivalent weight
E. Silver Nitrate			
Potassium bromide	KBr	1	119.01
Potassium chloride	KCl	1	74 55
Sodium chloride	$NaCl$	1	58.45
F. Alkali Thiocyanates			
Mercury .	Hg	$\frac{1}{2}$	100 31
Mercuric oxide	HgO	$\frac{1}{2}$	108 31
Silver	Ag	1	107 88
Silver nitrate .	$AgNO_3$	1	169 89

G. Miscellaneous

For the determination of substances that must pass through complicated reactions, it is best to standardize against a standard sample of the substance that has been carried through all steps of the analysis. The U S Bureau of Standards can supply at a nominal fee a large number of standard samples of irons and steels (representing a wide range in composition), iron ores, manganese ore, zinc ore, etc.

(1) May be obtained from the U. S. Bureau of Standards.
(2) Difficult to obtain with exactly two molecules of water but a valuable primary standard when carefully prepared
(3) The pure salt is hard to obtain and to keep without slight oxidation or loss of water, hence other standards are recommended
(4) Possesses many disadvantages and is not recommended
(5) The last few drops of iodine are decolorized very slowly. Titrate till the pale yellow color persists at least two minutes. Starch retards the reaction and should be avoided.

CORRECTION FOR CAPILLARY DEPRESSION OF MERCURY IN A GLASS TUBE

Correction to be added.

TRUE CAPACITY OF GLASS VESSELS FROM THE WEIGHT OF THE CONTAINED WATER OR MERCURY WHEN WEIGHED IN AIR WITH BRASS WEIGHTS*

A glass vessel containing G grams of water at a temperature of t°C has, at the same temperature, a capacity $V = W_t \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of t°C the capacity at the same temperature is given by $V = M_t \times G$ cubic centimeters.

A glass vessel containing G grams of water at a temperature of t°C has a capacity at a temperature of 18°C given by $V = W_{18°} \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of t°C the capacity at a temperature of 18°C is given by $V = M_{18°} \times G$ cubic centimeters. The true volume at temperature of 25°C when the weighing is made at t° is similarly obtained by use of the values under $W_{25°}$ and $M_{25°}$ for water and mercury respectively

* Assuming 25×10^{-6} as the coefficient of cubic expansion for glass.

Reduction of Weighings to Vacuo

If the apparent mass of a body is m, its density d_m, the density of the weights d_w and the density of the air d_a the true mass in vacuo is,

$$M = m + md_a\left(\frac{1}{d_m} - \frac{1}{d_w}\right)$$

DECI-NORMAL SOLUTIONS OF SALTS AND OTHER REAGENTS

The weight in grams of the compound in 1 c.c. of the following deci-normal solutions is found by dividing the H equivalent in the last column by 1000.

Name	Formula	At. or mol. wt	Hydrogen equivalent	One H equiv. in gms.
Acetic acid	$HC_2H_3O_2$	60 03	$HC_2H_3O_2$	6 003
Ammonia	NH_3	17 03	NH_3	1 703
Ammonium	NH_4	18 04	NH_4	1 804
Ammonium chloride	NH_4Cl	53 50	NH_4Cl	5 350
Ammonium sulfate	$(NH_4)_2SO_4$	132 14	$\frac{1}{2}(NH_4)_2SO_4$	6 607
Ammonium sulfocyanate	NH_4CNS	76 11	NH_4CNS	7 611
Barium	Ba	137.36	$\frac{1}{2}Ba$	6.868
Barium carbonate	$BaCO_3$	197 36	$\frac{1}{2}BaCO_3$	9 868
Barium chloride	$BaCl_2\ 2H_2O$	244 31	$\frac{1}{2}BaCl_2\ 2H_2O$	12 216
Barium hydroxide	$Ba(OH)_2$	171 38	$\frac{1}{2}Ba(OH)_2$	8 569
Barium oxide	BaO	153 36	$\frac{1}{2}BaO$	7 668
Bromine	Br	79 92	Br	7 992
Calcium	Ca	40 08	$\frac{1}{2}Ca$	2 004
Calcium carbonate	$CaCO_3$	100 08	$\frac{1}{2}CaCO_3$	5 004
Calcium chloride	$CaCl_2$	110 99	$\frac{1}{2}CaCl_2$	5 550
Calcium chloride	$CaCl_2.6H_2O$	219 09	$\frac{1}{2}CaCl_2.6H_2O$	10 954
Calcium hydroxide	$Ca(OH)_2$	74 10	$\frac{1}{2}Ca(OH)_2$	3 705
Calcium oxide	CaO	56 08	$\frac{1}{2}CaO$	2 804
Chlorine	Cl	35 46	Cl	3 546
Citric acid	$C_6H_8O_7.H_2O$	210 08	$\frac{1}{3}C_6H_8O_7.H_2O$	7 003
Cobalt	Co	58 94	$\frac{1}{2}Co$	2 948
Copper	Cu	63 57	$\frac{1}{2}Cu$	3 179
Copper Oxide	CuO	79 57	$\frac{1}{2}CuO$	3 979
Copper sulfate	$CuSO_4\ 5H_2O$	249 71	$\frac{1}{2}CuSO_4.5H_2O$	12 485
Cyanogen	CN	26 01	CN	2 601
Hydrochloric acid	HCl	36 47	HCl	3 647
Hydrocyanic acid	HCN	27 02	HCN	2 702
Iodine	I	126 93	I	12 693
Lactic acid	$C_3H_6O_3$	90 05	$C_3H_6O_3$	9 005
Malic acid	$C_4H_6O_5$	134 05	$\frac{1}{2}C_4H_6O_5$	6 702
Magnesium	Mg	24 32	$\frac{1}{2}Mg$	1 216
Magnesium carbonate	$MgCO_3$	84 32	$\frac{1}{2}MgCO_3$	4 216
Magnesium chloride	$MgCl_2$	95 23	$\frac{1}{2}MgCl_2$	4 762
Magnesium chloride	$MgCl_2\ 6H_2O$	203 33	$\frac{1}{2}MgCl_2.6H_2O$	10 167
Magnesium oxide	MgO	40 32	$\frac{1}{2}MgO$	2 016
Manganese	Mn	54 93	$\frac{1}{2}Mn$	2 747
Manganese sulfate	$MnSO_4$	150 99	$\frac{1}{2}MnSO_4$	7 550
Mercuric chloride	$HgCl_2$	271 52	$\frac{1}{2}HgCl_2$	13 576
Nickel	Ni	58 69	$\frac{1}{2}Ni$	2 935
Nitric acid	HNO_3	63 02	HNO_3	6 302
Nitrogen	N	14 01	N	1 401
Nitrogen pentoxide	N_2O_5	108 02	$\frac{1}{2}N_2O_5$	5 401

REDUCTIONS OF WEIGHINGS IN AIR TO VACUO

When the weight M in grams of a body is determined in air, a correction is necessary for the buoyancy of the air. The following table is computed for an air density of 0.0012. The corrected weight = M + kM /1000 values of k being found in the table.

Density of body weighed	Correction factor, k.		
	Pt Ir weights	Brass weights	Quartz or Al weights
5	+2 34	+2 26	+1 95
6	+1.94	+1.86	+1 55
7	+1 66	+1 57	+1 26
75	+1 55	+1 46	+1 15
80	+1 44	+1 36	+1 05

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS

Aluminum

(1) $Al_2(SO_4)_3 + 6KOH = 2Al(OH)_3 + 3K_2SO_4$

$$KOH = \frac{Al_2(SO_4)_3}{6} = \frac{Al_2O_3}{6} = \frac{Al}{3}$$

Antimony

(2) $SbCl_5 + 2KI = SbCl_3 + 2KCl + I_2$

$$I = \frac{Sb}{2} = \frac{Sb_2O_5}{4}$$

(3) $Sb_2O_3 + 2I_2 + 2H_2O = Sb_2O_5 + 4HI$

$$I = \frac{Sb_2O_3}{4} = \frac{Sb}{2}$$

(4) (a) $Sb_2S_3 + 6HCl = 2SbCl_3 + 3H_2S$
(b) $3H_2S + 3I_2 = 6HI + 3S$

$$I = \frac{H_2S}{2} = \frac{Sb_2S_3}{6} = \frac{Sb}{3}$$

(5) $5Sb_2(SO_4)_3 + 4KMnO_4 + 24H_2O = 10H_3SbO_4 + 2K_2SO_4 + 4MnSO_4 + 9H_2SO_4$

$$\frac{4KMnO_4}{20} = \frac{Sb_2(SO_4)_3}{4} = \frac{Sb_2O_3}{4} = \frac{Sb}{2}$$

Arsenic

(6) $As_2O_3 + 2H_2O + 2I_2 = As_2O_5 + 4HI$

$$I = \frac{As_2O_3}{4} = \frac{As}{2}$$

(7) $AsCl_3 + I_2 + 2HCl = AsCl_5 + 2HI$

$$I = \frac{AsCl_3}{2} = \frac{As}{2}$$

(8) As_2S_3 same as reaction 4

Boron

(9) (a) $Na_2B_4O_7 + 2HCl + 5H_2O - 2NaCl + 4H_3BO_3$
(b) $H_3BO_3 + NaOH = NaBO_2 + 2H_2O$

$$NaOH = H_3BO_3 = B$$

Cadmium

(10) $CdS + 2HCl + I_2 = CdCl_2 + 2HI + S$

$$I = \frac{CdS}{2} = \frac{Cd}{2} = \frac{S}{2}$$

Calcium

(11) $5CaC_2O_4 + 2KMnO_4 + 8H_2SO_4 = 5CaSO_4 + K_2SO_4 + 2MnSO_4 + 8H_2O + 10CO_2$

$$\frac{2KMnO_4}{10} = \frac{CaC_2O_4}{2} = \frac{CaCO_3}{2} = \frac{CaO}{2}$$

(12) $CaCO_3 + 2HCl = CaCl_2 + CO_2 + H_2O$

$$HCl = \frac{CaCO_3}{2} = \frac{CaO}{2}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

Carbon

(13) $Na_2CO_3 + H_2SO_4 = Na_2SO_4 + H_2O + CO_2$

$$\frac{H_2SO_4}{2} = \frac{Na_2CO_3}{2}$$

(14) $2NaHCO_3 + H_2SO_4 = Na_2SO_4 + 2H_2O + 2CO_2$

$$\frac{H_2SO_4}{2} = \frac{NaHCO_3}{1}$$

(15) $KHC_2O_4 + KOH = K_2C_2O_4 + H_2O$

$$KOH = KHC_2O_4$$

(16) $H_2C_2O_4.2H_2O + 2NaOH = Na_2C_2O_4 + 4H_2O$

$$NaOH = \frac{H_2C_2O_4.2H_2O}{2}$$

(17) $C_6H_5COOH + NaOH = C_6H_5COONa + H_2O$

$$NaOH = C_6H_5COOH$$

(18) $5Na_2C_2O_4 + 2KMnO_4 + 8H_2SO_4 = 5Na_2SO_4 + K_2SO_4 + 2MnSO_4 + 10CO_2 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{Na_2C_2O_4}{2}$$

Chlorine

(19) $NaCl + AgNO_3 = AgCl + NaNO_3$

$$NaCl = Cl$$

(20) (a) $Cl + KI = KCl + I$

(b) $I_2 + 2Na_2S_2O_3 = Na_2S_4O_6 + 2NaI$

$$I = Cl$$

(21) $CaOCl_2 + 2HCl = CaCl_2 + H_2O + Cl_2$

$$I = Cl = \frac{CaOCl_2}{2}$$

Chromium

(22) $K_2Cr_2O_7 + 6FeCl_2 + 14HCl = 6FeCl_3 + 2KCl + 2CrCl_3 + 7H_2O$

$$Fe = \frac{K_2Cr_2O_7}{6} = \frac{Cr_2O_3}{6} = \frac{Cr}{3}$$

(23) $K_2Cr_2O_7 + 6KI + 7H_2SO_4 = 4K_2SO_4 + Cr_2(SO_4)_3 + 7H_2O + 3I_2$

$$I = \frac{K_2Cr_2O_7}{6} = \frac{Cr_2O_3}{6} = \frac{Cr}{3}$$

Copper ($KMnO_4$ Method)

(24) (a) $2CuSO_4 + 2KCNS + H_2SO_3 + H_2O = 2CuCNS + K_2SO_4 + 2H_2SO_4$

(b) $CuCNS + NaOH = NaCNS + CuOH$

(c) $5NaCNS + 6KMnO_4 + 4H_2SO_4 = 3K_2SO_4 + 6MnSO_4 + 5NaCN + 4H_2O$

$$\frac{6KMnO_4}{30} = \frac{NaCNS}{6} = \frac{CuSO_4}{6} = \frac{Cu}{6}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

(25) (Iodide Method)

$$2CuSO_4 + 4KI = 2CuI + 2K_2SO_4 + I_2$$

$$I = CuSO_4 = Cu$$

(26) (KCN Method)

(a) $2CuSO_4 + 2NH_4OH = (NH_4)_2SO_4 + Cu_2SO_4(OH)_2$

(b) $Cu_2SO_4(OH)_2 + 6NH_3 + (NH_4)_2SO_4 = 2Cu(NH_3)_4SO_4.H_2O$

(c) $2Cu(NH_3)_4SO_4.H_2O + 7KCN = K_3NH_4Cu_2(CN)_6 + NH_4CNO + 2K_2SO_4 + 6NH_3 + H_2O$

$$\frac{KCN}{2} = \frac{Cu(NH_3)_4SO_4.H_2O}{7} = \frac{CuSO_4}{7} = \frac{Cu}{7}$$

Iodine

(27) $I_2 + 2Na_2S_2O_3 = Na_2S_4O_6 + 2NaI$

$$I = Na_2S_2O_3$$

(28) $KIO_3 + 5KI + 6HCl = 6KCl + 3H_2O + 3I_2$

$$I = \frac{KIO_3}{6} = \frac{5KI}{6}$$

(29) $10KI + 2KMnO_4 + 8H_2SO_4 = 6K_2SO_4 + 2MnSO_4 + 8H_2O + 5I_2$

$$\frac{2KMnO_4}{10} = I$$

Iron

(30) $6FeCl_2 + K_2Cr_2O_7 + 14HCl = 6FeCl_3 + 2KCl + 2CrCl_3 + 7H_2O$

$$\frac{K_2Cr_2O_7}{6} = \frac{6FeCl_2}{6} = \frac{Fe_2O_3}{2} = \frac{Fe}{1}$$

(31) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{10FeSO_4}{10} = \frac{Fe_2O_3}{2} = \frac{Fe}{1}$$

(32) $2FeCl_3 + 2KI = 2KCl + 2FeCl_2 + I_2$

$$I = FeCl_3 = Fe = \frac{Fe_2O_3}{2}$$

Lead

(33) $2Pb(C_2H_3O_2)_2 + K_2Cr_2O_7 + H_2O = 2PbCrO_4 + 2KC_2H_3O_2 + 2HC_2H_3O_2$

$\frac{2Pb}{4} = \frac{K_2Cr_2O_7}{4}$ (as precipitating agent for lead)

(34) $2PbCrO_4 + 6KI + 16HCl = 2PbCl_2 + 6KCl + 2CrCl_3 + 8H_2O + 3I_2$

$$I = \frac{PbCrO_4}{3} = \frac{Pb}{3} = \frac{K_2Cr_2O_7}{6}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

Manganese

(35) $MnO_2 + H_2SO_4 + H_2C_2O_4 = MnSO_4 + 2CO_2 + 2H_2O$

$$\frac{2KMnO_4}{10} = \frac{C_2H_2O_4}{2} = \frac{MnO_2}{2} = \frac{Mn}{2}$$

(36) (Bismuthate Method)

(a) $2Mn(NO_3)_2 + 5NaBiO_3 + 16HNO_3 = 5NaNO_3 + 5Bi(NO_3)_3 + 7H_2O + 2HMnO_4$

(b) $2HMnO_4 + 5Na_3AsO_3 + 4HNO_3 = 5Na_3AsO_4 + 2Mn(NO_3)_2 + 3H_2O$

$$\frac{2HMnO_4}{10} = \frac{Na_3AsO_3}{2} = \frac{Mn}{5}$$

(37) (Persulfate Method)

(a) $2Mn(NO_3)_2 + 5(NH_4)_2S_2O_8 + 8H_2O = 5(NH_4)_2SO_4 + 4HNO_3 + 5H_2SO_4 + 2HMnO_4$

(b) $2HMnO_4 + 10FeSO_4 + 7H_2SO_4 = 5Fe_2(SO_4)_3 + 2MnSO_4 + 8H_2O$

$$\frac{2HMnO_4}{10} = \frac{10FeSO_4}{10} = \frac{Mn}{5}$$

(38) (Volhard's Method)

$3MnSO_4 + 2KMnO_4 + 2H_2O = 5MnO_2 + K_2SO_4 + 2H_2SO_4$ *or*

$6MnSO_4 + 5ZnSO_4 + 4KMnO_4 + 14H_2O = 4KHSO_4 + 7H_2SO_4 + 5Zn(OH)_2.2MnO_2$

$$\frac{2KMnO_4}{10} = \frac{3MnSO_4}{10} = \frac{3Mn}{10}$$

(39) (Ford Williams Method)

$MnO_2 + 2FeSO_4 + 2H_2SO_4 = MnSO_4 + Fe_2(SO_4)_3 + 2H_2O$

$$\frac{2FeSO_4}{2} = \frac{MnO_2}{2} = \frac{Mn}{2}$$

Molybdenum

(40) (a) $2MoO_3 + 3Zn = Mo_2O_3 + 3ZnO$

(b) $5Mo_2O_3 + 6KMnO_4 + 9H_2SO_4 = 10MoO_3 + 3K_2SO_4 + 6MnSO_4 + 9H_2O$

$$\frac{6KMnO_4}{30} = \frac{Mo_2O_3}{6} = \frac{MoO_3}{3} = \frac{Mo}{3}$$

Nickel (KCN Method).

(41) (a) $2NiSO_4 + 12NH_4OH = 2Ni(NH_3)_6SO_4 + 12H_2O$

(b) $Ni(NH_3)_6SO_4 + 4KCN = K_2Ni(CN)_4 + K_2SO_4 + 6NH_3$

$$\frac{4KCN}{8} = \frac{Ni(NH_3)_6SO_4}{8} = \frac{Ni}{8}$$

Oxygen

(42) $5H_2O_2 + 2KMnO_4 + 4H_2SO_4 = 2KHSO_4 + 2MnSO_4 + 8H_2O + 5O_2$

$$\frac{2KMnO_4}{10} = \frac{H_2O_2}{2}$$

Phosphorus

(43) (a) $H_3PO_4 + 12(NH_4)_2MoO_4 + 21HNO_3 = (NH_4)_3PO_4.12MoO_3 + 21NH_4NO_3 + 12H_2O$

(b) $2(NH_4)_3PO_4.12MoO_3 + 46NaOH + H_2O = 2(NH_4)_2HPO_4 + (NH_4)_2MoO_4 + 23Na_2MoO_4 + 23H_2O$

$$\frac{NaOH}{1} = \frac{2(NH_4)_3PO_4.12MoO_3}{46} = \frac{P_2O_5}{46} = \frac{P}{23}$$

(44) (a) $2(NH_4)_3PO_4.12MoO_3 + 46NH_4OH + H_2O = 24(NH_4)_2MoO_4 + 2(NH_4)_2HPO_4 + 23H_2O$

(b) $(NH_4)_2MoO_4 + H_2SO_4 = (NH_4)_2SO_4 + H_2MoO_4$

(c) $2MoO_3 + 3Zn + 3H_2SO_4 = 3ZnSO_4 + 3H_2O + Mo_2O_3$

(d) $5Mo_2O_3 + 6KMnO_4 + 9H_2SO_4 = 10MoO_3 + 3K_2SO_4 + 6MnSO_4 + 9H_2O$

$$\frac{6KMnO_4}{30} = \frac{Mo_2O_3}{6} = \frac{(NH_4)_3PO_4.12MoO_3}{36} = \frac{P}{36} = \frac{P_2O_5}{72}$$

(45) (No ferric alum present)

(a-b-c) as in Reaction 44

(d) $12Mo_2O_3 + O = Mo_{24}O_{37}$

(e) $Mo_{24}O_{37} + 14KMnO_4 + 21H_2SO_4 = 24MoO_3 + 7K_2SO_4 + 14MnSO_4 + 21H_2O$

$$\frac{14KMnO_4}{70} = \frac{Mo_{24}O_{37}}{70} = \frac{(NH_4)_3PO_4.12MoO_3}{35} = \frac{P}{35} = \frac{P_2O_5}{70}$$

Sulfur

(46) $H_2S + I_2 = 2HI + S$

$$I = \frac{H_2S}{2} = \frac{S}{2}$$

(47) $H_2SO_4 + 2NaOH = Na_2SO_4 + 2H_2O$

$$NaOH = \frac{Na_2SO_4}{2}$$

(48) $NaHSO_4 + NaOH = Na_2SO_4 + H_2O$

$NaOH = NaHSO_4$

(49) $Na_2SO_3 + I_2 + H_2O = Na_2SO_4 + 2HI$

$$I = \frac{Na_2SO_3}{2} = \frac{SO_2}{2} = \frac{S}{2}$$

(50) $2Na_2S_2O_3 + I_2 = Na_2S_4O_6 + 2NaI$

$I = Na_2S_2O_3$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

Tin

(51) $SnCl_2 + I_2 + 2HCl = SnCl_4 + 2HI$

$$I = \frac{SnCl_2}{2} = \frac{Sn}{2}$$

Titanium

(52) (a) $Ti_2(SO_4)_3 + Fe_2(SO_4)_3 = 2Ti(SO_4)_2 + 2FeSO_4$

(b) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{FeSO_4}{1} = \frac{Ti_2(SO_4)_3}{2} = \frac{Ti}{1}$$

Tungsten

(53) $WO_3 + 2NaOH = Na_2WO_4 + H_2O$

$$\frac{NaOH}{1} = \frac{WO_3}{2} = \frac{W}{2}$$

Uranium

(54) (a) $U_3O_8 + 4H_2SO_4 = 2UO_2SO_4 + U(SO_4)_2 + 4H_2O$

(b) $5U(SO_4)_2 + 2KMnO_4 + 2H_2O = 2KHSO_4 + 2MnSO_4 + H_2SO_4 + 5UO_2SO_4$

$$\frac{2KMnO_4}{10} = \frac{U(SO_4)_2}{2} = \frac{UO_2}{2} = \frac{U}{2}$$

(c) $U_3O_8 = 2UO_3 + UO_2$

$$\frac{2KMnO_4}{10} = \frac{U_3O_8}{2} = \frac{3U}{2}$$

Vanadium

(55) (a) $V_2O_5 + SO_2 \rightleftarrows V_2O_4 + SO_3$

(b) $5V_2O_4 + 2KMnO_4 + 3H_2SO_4 = 5V_2O_5 + K_2SO_4 + 2MnSO_4 + 3H_2O$

$$\frac{2KMnO_4}{10} = \frac{V_2O_4}{2} = \frac{V_2O_5}{2} = \frac{V}{1}$$

(56) (a) $V_2O_5 + 3Zn + 3H_2SO_4 = V_2O_2 + 3H_2O + 3ZnSO_4$

(b) $V_2O_2 + 3Fe_2O_3 = 6FeO + V_2O_5$

(c) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{FeSO_4}{1} = \frac{V_2O_5}{6} = \frac{V}{3}$$

57) (a) As in Reaction 56

(b) $5V_2O_2 + 6KMnO_4 + 9H_2SO_4 = 5V_2O_5 + 3K_2SO_4 + 6MnSO_4 + 9H_2O$

$$\frac{6KMnO_4}{30} = \frac{V_2O_5}{6} = \frac{V_2O_2}{6} = \frac{V}{3}$$

(58) $V_2O_5 + 2KI + 2HCl = V_2O_4 + 2KCl + H_2O + I_2$

$$I = \frac{V_2O_5}{2} = \frac{V}{1}$$

Zinc

(59) (a) $Fe_2(SO_4)_3 + Zn = ZnSO_4 + 2FeSO_4$

(b) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{FeSO_4}{1} = \frac{Zn}{2}$$

(60) $3ZnCl_2 + 2K_4Fe(CN)_6 = K_2Zn_3(Fe(CN)_6)_2 + 6KCl$

$$\frac{K_4Fe(CN)_6}{3} = \frac{3ZnCl_2}{6} = \frac{Zn}{2}$$

EFFICIENCY OF DRYING AGENTS

Compiled by John H. Yoe

A Drying agents depending upon chemical action (absorption) for their efficiency:*

Substance	Weights of residual water vapor in dried air—mg per liter	Authority
P_2O_5.	Much less than 1 mg in 40,000 liters	Morley
$Mg(ClO_4)_2$ anh	Unweighable in 210 liters	Willard and Smith
$Mg(ClO_4)_2\,3H_2O$	Unweighable in 57 liters	Willard and Smith
BaO.	. .	Booth and McIntire
$CaSO_4\,\frac{1}{2}H_2O$.	. . . ..	Smith
KOH (fused)	0 002	Baxter and Starkweather
H_2SO_4	0 003	Baxter and Starkweather
MgO .	0 008	Dover and Marden
NaOH (fused)	0 16	Baxter and Starkweather
$CaBr_2$ . ..	0 2	Baxter and Warren
CaO... . ..	0 2	Dover and Marden
B_2O_3 .	.. ..	Walton and Rosenbaum
$Ba(ClO_4)_2$ anh	.	Smith
$CaCl_2$ (granular)	0 14 to 0 25	McPherson
$CaCl_2$ (fused)	0 36	Baxter and Starkweather
$ZnCl_2$	0 8	Baxter and Warren
$ZnBr_2$	1 1	Baxter and Warren
$CuSO_4$ anh	1 4	Dover and Marden

B Drying agents depending upon physical action (adsorption) for their efficiency *—Alumina (low temperature fired), asbestos, charcoal, clay and porcelain (low temperature fired), glass wool, kieselguhr, silica gel, refrigeration

* It should be noted that the efficiency of some drying agents (*e. g.* $Al_2O_3.xH_2O$ and anhydrous $CaCl_2$, and probably also BaO, anhydrous $Mg(ClO_4)_2$, $Mg(ClO_4)_2.3H_2O$, anhydrous $Ba(ClO_4)_2$, and $CaSO_4\,\frac{1}{2}H_2O$) depends upon both adsorption and absorption.

A METHOD OF BALANCING EQUATIONS FOR OXIDATION-REDUCTION REACTIONS

On the left-hand side of the equation write the formulae for all the compounds entering into the reaction. On the right-hand side write the formulae for all the compounds formed in the reaction.

Determine the L. C. M. (least common multiple) of the numbers representing the changes in valence per molecule of the oxidizing and reducing agents.

The quotient obtained in dividing the L. C. M. by the number representing the valence change per molecule is the number of molecules of that compound required, or formed.

The reaction between $FeSO_4$, $KMnO_4$, and H_2SO_4 serves to illustrate. Following the rule as given above we write, $KMnO_4 + FeSO_4 + H_2SO_4 \rightarrow K_2SO_4 + MnSO_4 + Fe_2(SO_4)_3 + H_2O$.

The valence change of manganese is five, that of iron is two per molecule of $Fe_2(SO_4)_3$. The L. C. M. of these two numbers is ten.

The quotient obtained by dividing the L. C. M. by the valence change of manganese is two. Therefore two molecules of $KMnO_4$ are required. The quotient obtained by dividing the L. C. M. by the valence change of iron per molecule of $Fe_2(SO_4)_3$ is five. Five molecules of $Fe_2(SO_4)_3$ are formed. Ten molecules of $FeSO_4$ are needed. From the two molecules of $KMnO_4$ used one molecule of K_2SO_4 is formed, as well as two molecules of $MnSO_4$.

Eighteen sulfate radicals are used in forming the salts; ten of these radicals are supplied by the $FeSO_4$ used, the other eight must be supplied by the free acid. The sixteen hydrogens form eight molecules of water.

The complete equation is, therefore,

$$2KMnO_4 + 10FeSO_4 + 8H_2SO_4 \rightarrow K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O.$$

SOLUBILITY CHART

Abbreviations: W, soluble in water; A, insoluble in water but soluble in acids; w, sparingly
I, insoluble in both water and acids; d, decomposes in water * Certain salts occur in two

SOLUBILITY OF INORGANIC COMPOUNDS IN WATER

The table shows the number of grams of the anhydrous substance indicated in the first column which can be dissolved in 100 grams of water at the temperature in degrees Centigrade given at the top. When the formula is preceded by a * the solubility is stated in grams of anhydrous substance in 100 grams of saturated solution; when preceded by ** the solubility is stated in grams of anhydrous substance in 100 c.c. of the saturated solution. The column headed with S. P. shows the solid phase hydrated form in equilibrium with the saturated solution.

α, the absorption coefficient, is the volume of gas when reduced to 0° and 760 mm., absorbed by one volume of water when the pressure of the gas itself, without the aqueous tension, amounts to 760 mm.

q is the weight of gas in grams dissolved in 100 grams of water when the total pressure (i.e., the sum of the partial pressure of the gas plus the aqueous tension at the given temperature) is 760 mm.

GASES IN WATER

l is the volume of gas in c.c. dissolved by one volume of water when the total pressure (i.e., the sum of the partial pressure of the gas plus the aqueous tension at the given temperature) is 760 mm.

	Carbon Monoxide		Hydrogen Sulfide		Sulfur Dioxide		Nitric Oxide		Air**

TABLE OF INDICATORS

Due to hydrolysis of the salt formed, the composition of a weak acid solution titrated against a strong base is basic (when equivalent amounts of acid and base are present) and of a weak base against a strong acid is acid. A truly neutral titrated solution has the same concentration of hydrogen ions $[H^+]$ and hydroxyl ions $[OH^-]$ as water. Water has a concentration of $[H^+]$ ion of 10^{-7} and of $[OH^-]$ ion of 10^{-7} at 25°C. As an index of the acid intensity the expression pH is employed and is equal to the logarithm of the reciprocal of the hydrogen ion concentration; i. e., $pH = \log \frac{1}{[H^+]}$ per liter. From this it follows that the pH of a neutral solution is the same as that of water; viz., 7; an acid solution has a pH less than 7 and a basic solution has a pH greater than 7. Those indicators in the table below with a * are the Sörensen selected indicators; those with a # are the Clark and Lubs selected indicators; those with the ## are Cohen's supplement to the Clark and Lubs selection; those with the *E* are the Eastman indicators.

1,3,5-Trinitrobenzene	....	14–14.3 E	

[2] Phenolphthalein may be used in the presence of weak acids.

PREPARATION OF CLARK AND LUBS INDICATOR SOLUTIONS

To prepare a 0.04% indicator reagent, 0.1 gram of the dry indicator is mixed in a mortar with the number of cubic centimeters of 0.01 *N* sodium hydroxide as given in the table below and the mixture diluted to 250 cc with water. Such solutions give satisfactory results when five drops of indicator are added to 10 cc of the solution to be tested.

Indicator	0.01 *N* NaOH cc	Indicator	0.01 *N* NaOH cc
Brom cresol green	14.3	Chlor phenol red	23.6
Brom cresol purple	18.5	Cresol red	26.2
Brom phenol blue	14.9	Meta cresol purple	26.2
Brom phenol red	19.5	Phenol red	28.2
Brom thymol blue	16.0	Thymol blue	21.5

CONVERSION FACTORS—pH TO E. M. F.

When the half-cell:

KCl (saturated)|KCl (0.1*N*), HgCl (s)|Hg is used as a standard of reference and it is assumed, arbitrarily that in the cell:

$$\underset{A}{\text{Pt, } H_2 \text{ (1 atmosphere)}|}H^+ \text{ (unknown activity)}\underset{B}{|}\text{KCl (saturated)}\underset{C}{|}\text{KCl (0.1}N\text{), HgCl (s)}\underset{D}{|}\text{Hg}$$

the potential difference at **B** remains constant with variations of "H (unknown activity)" and that the sum of the potential differences at **B, C** and **D** is Σ as follows: (cf. Clark: *Determination of Hydrogen Ions*, 3d Ed., 1928).

t°C	18	20	25	30
Potential difference (Σ) volts	0 3380	0 3379	0.3376	0.3371

t°C	35	38	40
Potential difference (Σ) volts	0.3365	0.3361	0.3358

then,

$$\text{pH} = \frac{\text{E. M. F.} - \Sigma}{0.00019832 \times T}$$ where T is the absolute temperature.

CONVERSION FACTORS—pH TO E.M.F. (Continued)

Calomel Electrode

The voltage of the calomel electrode at 25°C. is for the half-cell:

$$Hg|HgCl,\ (N)\ KCl|| = +0.2822$$
$$Hg|HgCl,\ (0.1N\ KCl)|| = +0.3376$$
$$Hg|HgCl,\ (saturated)\ KCl|| = +0.2458$$

From this the relation of the E. M. F. and pH (of a cell composed of a hydrogen electrode and one of the calomel electrodes) is given by:

$$pH = \frac{E.\ M.\ F. - \Sigma}{0.0591}\ (at\ 25°C.)$$

Quinhydrone Electrode

The normal electrode potential (E_h) of the quinhydrone electrode referred to the normal hydrogen electrode at t°C. is given by the expression:

$$E_h = 0.7177 - 0.00074t$$

McILVAINE'S STANDARD BUFFER SOLUTIONS

Stock solution A: 0.1 molar citric acid ($C_6H_8O_7$) solution.
Stock solution B: 0.2 molar disodium phosphate (Na_2HPO_4) solution.

pH VALUES FOR POTENTIOMETER READINGS

Harold V. Gaskill

The following table presents pH values for various potentiometer readings using the quinhydrone half-cell and saturated calomel half-cell at 25°C. The argument is potential in millivolts and the table entries are in terms of pH. The table was constructed upon the following formula:

$$\text{pH} = \frac{0.4538 - E_q}{0.0591}$$

in which E_q is the observed potential in volts.[1]

The temperature factor is 0.77 millivolts per degree, to be added above 25°C and subtracted below 25°C.

Polarity is reversed above 7.68 pH.

Millivolts	.0	1	.2	3	4	.5	6	7	8	.9

APPROXIMATE pH VALUES

The following tables give approximate pH values for a number of substances such as acids, bases, foods, biological fluids, etc. All values are rounded off to the nearest tenth and are based on measurements made at 25° C. A few buffer systems with their pH values are also given.

Jams, fruit	3.5–4.0	Tuna	5.9–6.1
Jellies, fruit	2.8–3.4	Turnips	5.2–5.6
Lemons	2.2–2.4	Vinegar	2.4–3.4
Limes	1.8–2.0	Water, drinking	6.5–8.0
Maple syrup	6.5–7.0	Wines	2.8–3.8

APPROXIMATE pH VALUES (Continued)

BUFFER SYSTEMS

The following table gives some common buffer systems and the approximate pH of maximum buffer capacity. The zone of effective buffer action will vary with concentration but, for concentrations approximately 0.1 molar, the general average will be ± 1.0 pH from the value given.

Glycocoll-sodium chloride-hydrochloric acid	2.0
Potassium acid phthalate-hydrochloric acid	2.8
Primary potassium citrate	3.7
Acetic acid-sodium acetate	4.6
Potassium acid phthalate-sodium hydroxide	5.0
Secondary sodium citrate	5.0
Potassium acid phosphate-disodium phosphate	6.8
Potassium acid phosphate-sodium hydroxide	6.8
Boric acid-borax	8.5
Borax	9.2
Boric acid-sodium hydroxide	9.2
Sodium bicarbonate-sodium carbonate	10.2
Disodium phosphate-sodium hydroxide	11.5

POLAROGRAPHIC ANALYSIS

Courtesy E. H. Sargent and Co., 155–165 East Superior Street, Chicago, Illinois.

All values in the following tables are volts referred to the normal calomel electrode.

Table I
Cathodic Reduction Potentials of Metals (Half Wave)

Name	Valence	Neutral or acid	Alkali	Ammonia-Ammonium Chloride	Cyanide	Citrate or Tartrate	Thiocyanate	Ammonium-Carbonate	Pyridine
Aluminum	3	−1 7							
Ammonium	1	−2 09							
Antimony.	3	−0 2	−1 8		−1 13				
Barium	2	−1 94

25	67.89	60	74.18	95	81.77
30	68.80	65	75.88	100	82.97

POTENTIALS OF ELECTROCHEMICAL REACTIONS AT 25° C

Compiled by Thos. DeVries

The reactions are classified according to the main element or radical entering into the reaction. Radicals are found under the name of the parent element. The sign of the potential is the sign on the electrode, according to the "European system".

Reaction	Potential, volts

Salts

Approximate degree of ionization for active salts in N/10 solution:

Type R^+R^- (e.g. KCl)	0.86
Type R^{++} $(R^-)_2$ (e.g. $BaCl_2$)	0.72
Type $(R^+)_2R^{--}$ (e.g. K_2SO_4)	0.72
Type R^{++} R^{--} (e.g. $CuSO_4$)	0.45

SOLUBILITY PRODUCT

The solubility product (or ion product constant) is the product of the concentrations of the ions in the saturated solution of a difficultly soluble salt. The concentrations are expressed as moles per liter of solution. The number of cations (or anions) resulting from the dissociation of one molecule of the salt, appears in the formula for calculations of the solubility product as the exponent of the concentration of the cation (or anion).

If two solutions, each containing one of the ions of a difficultly soluble salt, are mixed, no precipitation takes place unless the product of the ion concentrations in the mixture is greater than the solubility product.

In a solution containing two salts which yield a common ion the ratio of solubilities of the two salts is the ratio of the solubility products.

PROPERTIES OF THE AMINO ACIDS

Compiled by M. S. Dunn
with the cooperation of Frank J. Ross and M. Palmer Stoddard

Data are given in the following tables for the *dl*, *d*(+), *d*(−), *l*(+), and *l*(−) forms of the amino acids which are considered to be constituents of native proteins. All of the naturally occurring forms of the amino acids have the "*l*" configuration around the alpha carbon atom. The symbols (+) and (−) refer to the direction of rotation in water at 25°C. The values quoted are those considered to be most reliable.

Composition of the Amino Acids

The molecular weights and percentage composition of the amino acids given in the following table were calculated from the 1939 International Atomic Weights.

Amino acid	Empirical formula	Molecular weight	Percentage Composition			
			Carbon	Hydrogen	Oxygen	Nitrogen
Alanine	$C_3H_7O_2N$	89.095	40.440	7.920	35.917	15.723
Arginine	$C_6H_{14}O_2N_4$	174.205	41.365	8.102	18.369	32.164

[1] 26.68 per cent sulfur. [2] 58.622 per cent iodine. [3] 21.486 per cent sulfur. [4] 65.345 per cent iodine.

IONIZATION CONSTANTS AND pH VALUES AT THE ISOELECTRIC POINTS OF THE AMINO ACIDS IN WATER AT 25°C

The majority of the recorded values are true thermodynamic constants calculated from electrometric force measurements of cells without liquid junctions. The values for the constants given in the table were derived from the classical, the zwitterionic (Bjerrum), and the acidic (Bronsted) formulations of ionization and the corresponding mass law expressions. pH values at the isoelectric points were calculated from the expression, $pI = \frac{1}{2}(pk_{a1} + pk_w - pk_{b1})$. The error is approximately 0.5 per cent when this expression is used to calculate pI values for cystine, tyrosine, and diiodotyrosine.

Specific Rotations of the Amino Acids Using Sodium Light (5893 Å)

Abbreviations

c—grams of solute per 100 ml. of solution.
d—density of the solution.
p—grams of solute per 100 grams of solution.
l—length of the tube in decimeters.
α—observed rotation in angular degrees.
$[\alpha]$—specific rotation in angular degrees calculated from

$$[\alpha]_{\lambda}^{t} = \frac{\alpha \times 100}{c \times l} = \frac{\alpha \times 100}{p \times d \times l}$$ where t is temperature in °C and λ is wave length of the incident light in Ångstroms.

A—prepared from a protein or other naturally occurring material.
B—prepared by resolution of the inactive synthetic form.
C—prepared by resolution of the inactive racemized form.
D—prepared from the inactive synthetic form by a biological method.
E—prepared from the inactive racemized form by a biological method.
?—source not given.

l(+)-Valine	8 34	8.85	9.62	10.24*	.	6

* Value at 65°.

† Dunn and Stoddard (7) report 2.19 g. at 25° for *l*(−)-leucine rendered methionine-free by repeated recrystallization from 6 *N* HCl. Hlynka (8) found 2.20 g. at 25° and 2.66 g. at 50° for *l*(−)-leucine rendered methionine-free [by S. W. Fox (9)] by fractional crystallization of the formyl derivative and identical values for *d*(+)-leucine obtained by resolution of the *dl*-form.

‡ The following values were found by Loring and du Vigneaud (10): *dl*-cystine (0.0049g), *d* (+)-cystine (0.0108 g), and *meso*-cystine (0.0056 g) at 25°.

* These values are doubtful but they indicate the relative activity of the elements and are therefore included.

1. **Action of Metals on Salts.**—Any metal will replace any other metal *below* it in the series thus:

$$Mg + FeSO_4 \rightarrow MgSO_4 + Fe$$
$$Zn + CuSO_4 \rightarrow ZnSO_4 + Cu$$
$$Sn + 2AgNO_3 \rightarrow Sn(NO_3)_2 + 2Ag$$
$$Cu + Hg(NO_3)_2 \rightarrow Cu(NO_3)_2 + Hg$$

This is the fundamental principle of the Daniell Cell. The voltage of such a cell depends upon the difference between the electrode potentials of the metals employed. Thus the Zn-Cu couple gives a greater E.M.F. than the Zn-Pb couple or the Fe-Cu couple.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

2. **Action of Metals on Acids.**—Metals *above* H_2 react with HCl and dilute H_2SO_4, replacing the H_2

$$Zn + \text{dil. } H_2SO_4 \rightarrow ZnSO_4 + H_2$$
$$Sn + 2HCl \rightarrow SnCl_2 + H_2$$
$$Cu + \text{dil } H_2SO_4 \rightarrow \text{no reaction}$$

Metals above Pt react with HNO_3 and *hot conc* H_2SO_4

$$2Ag + 2 \text{ conc. } H_2SO_4 \rightarrow Ag_2SO_4 + SO_2 + 2H_2O$$
$$3Zn + 8 \text{ conc. } HNO_3 \rightarrow 3Zn(NO_3)_2 + 2NO + 4H_2O$$
$$3Cu + 8 \text{ dil. } HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$$

The acid first oxidizes the metal and the reaction may be explained as follows

Some of the acid takes on water and ionizes thus:

$$2HNO_3 + 4H_2O \rightleftarrows 10OH^- + 2N^{+++++}$$

Nitrogen gains 3 electrons and copper loses 2 electrons:

$$2(N^{+++++} + 3e) + 3(Cu - 2e) \rightarrow 3Cu^{++} + 2N^{++}$$

Some of the acid ionizes as follows·

$$6HNO_3 \leftrightarrows 6H^+ + 6NO_3^-$$
$$3Cu^{++} + 6NO_3^- \rightarrow 3Cu(NO_3)_2$$
$$10OH^- + 6H^+ + 2N^{++} \rightarrow 2NO + 8H_2O$$

added $\quad 3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$

3. **In Regard to Ease of Reduction of Oxides.**—The metallic oxides down to and including Mn can not be completely reduced to the metal state, even in a current of hydrogen. The oxides of Cd and succeeding metals are easily reduced, and far down the list, the oxides of silver, platinum, mercury, and gold are reduced (decomposed into metal and oxygen) even by heat alone

4. **In Regard to Ease of Rusting. (Oxidation in the Air.)**—The alkali and alkaline-earth metals rust very rapidly and with considerable evolution of heat All the metals down to copper rust with comparative ease. The metals below copper do not rust Assuming the electrolytic theory of the process of rusting to be true, these facts are just about what might have been predicted.

5. **In Regard to the Occurrence of the Metals in the Free State in Nature.**—Natural waters are frequently dilute solutions of carbonic, nitric, humic, etc , acids. As such they contain displaceable hydrogen. Metals *above* hydrogen in the E.M.F series scarcely, if ever, occur in the free state in nature, but are practically without exception found in the combined state, as sulfides, carbonates, etc. Metals *below* hydrogen are frequently found in the free state in nature. Thus gold is found in the form of nuggets of metallic gold However, metals below hydrogen are also found in the combined state, as cinnabar, HgS, etc

6 **In Regard to Action of the Metals on Water.**—The alkali and alkaline-earths metal displace hydrogen from water, even in the cold, and with evolution of much heat Mg and succeeding metals will displace hydrogen from steam. Metals at the bottom of the list will not displace hydrogen from steam.

7. **In Regard to the Solubility and Stability of Hydroxides.**—The alkali metal oxides have great avidity for water, forming hydroxides The alkaline-earth metal oxides react with less readiness, forming hydroxides. MgO reacts slowly and incompletely with water, forming the hydroxide All the other metallic oxides and hydroxides are insoluble in water and have no perceptible reaction therewith. When a solution of NaOH acts on solutions of salts of the metals, the alkali metal salts are not precipitated. The alkaline-earth metal salts are not precipitated unless in very concentrated solution. All the other metal solutions are acted upon, with precipitation of hydroxides, except in the case of copper which first gives copper hydroxide (blue), and which, on warming, changes to copper oxide (black). Also in the case of arsenic, no precipitate falls, sodium arsenite being formed. In the case of the last metals in the series, the *oxide* is precipitated, instead of the hydroxide, thus NaOH acting on salts of Sb, Hg, Ag, Pd, Pt, and Au, causes a precipitation of the *oxides* of these metals. Bismuth, as an exception, gives a normal hydroxide.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

8. **In Regard to Carbonates.**—The alkali metals form normal stable, soluble carbonates, not easily decomposed on heating. The alkaline-earth metals form normal carbonates, which are insoluble in water, and which decompose upon heating, leaving the oxide, carbon dioxide being evolved. When sodium carbonate solution acts on solutions of all the other metals, as a rule, a basic carbonate is precipitated, being insoluble in water, and decomposed by heat into oxide and carbon dioxide. If the solution is cold, Ag, Hg, Cd, Fe, and Mn give normal carbonates. If the solution is warm, Sb, Hg, Ag, Pd, Pt, and Au give a precipitate of the *oxide*, instead of the carbonate, thus showing the instability of the carbonates of the lowest metals in the series.

9. **In Regard to Nitrates.**—The nitrates of the alkali metals decompose when strongly heated forming the *nitrite* and oxygen. The nitrates of the heavy metals, down to and including copper, decompose when heated forming the oxide of the metal, oxygen and nitrogen dioxide. Mercury nitrate when heated yields mercury, oxygen and nitrogen dioxide.

REDUCTION VALUES FOR GLUCOSE IN BLOOD

Procedure

Into a test tube (15×150 mm.) pipette 1 c.c. 0.1 normal NaOH and 5 c.c. 0.45% zinc sulfate solution; 0.1 c.c. of blood from a capillary pipette is added being washed out with the mixture in the test tube; heat for 3 minutes in a boiling water bath; filter through cotton into a test tube (30×90 mm.) and wash the filter with two 3 c.c. portions of water. Add 2 c.c. of alkaline ferricyanide solution (1.65 g potassium ferricyanide, 10.6 g anhydrous sodium carbonate in 1000 c.c. of water) and heat in a boiling water bath for 15 minutes; cool and add 3 c.c. of the iodide-sulfate solution (5 g potassium iodide, 10 g zinc sulfate, 50 g sodium chloride and sufficient water to make 200 c.c.) and 2 c.c. of 3% acetic acid solution. Titrate with 0.005 normal sodium thiosulfate using starch indicator. The method is based upon the reduction of alkaline ferricyanide by glucose and the subsequent titration of the excess unreduced ferri cyanide according to the following equation: $2H_3Fe(CN)_6 + 2HI = 2H_4Fe(CN)_6 + I_2$

REDUCTION VALUES FOR GLUCOSE (Continued)

Amounts of Glucose Corresponding to Titration Values when 5 c.c. of 1:10 Blood Filtrate and 5 c.c. of Copper Reagent (Modified*) are Heated in a Water Bath for 15 Minutes. M. Somogyi, Jour. Biol. Chem. **70**, 599 (1926).

To 2 c.c. of 0.0667 normal H_2SO_4 in a test tube add 0.2 c.c. of blood, rinsing the pipette several times with the liquid in the test tube; add exactly 0.8 c.c. of 2.5% sodium tungstate solution; centrifugate; fasten a small tuft of absorbent cotton over the end of a 2 c.c. pipette and with this pipette remove 2 c.c. of the blood filtrate in the test tube and deliver it into a 16 × 150 mm test tube; add exactly 2 c.c. of the sugar-copper reagent; mix; heat in a boiling water bath for 15 minutes; cool to 35°C; add 1 c.c. 2 normal H_2SO_4 and titrate with 0.005 normal $Na_2S_2O_3$. A blank using 0.2 c.c. of water in place of the blood is run at the same time.

* Modified tartrate-carbonate copper reagent.—Copper sulfate (crystalline) 6.5 g; Rochelle salt 12 g; sodium carbonate (anhydrous) 20 g; potassium iodide 10 g; potassium iodate 0.8 g; potassium oxalate 18 g; sodium bicarbonate 25 g; water sufficient to make one liter of solution.

CUPROUS OXIDE EQUIVALENT OF DEXTROSE, INVERT SUGAR, LACTOSE AND MALTOSE

(Munson and Walker, Jour. Amer. Chem. Soc. 28, 663 (1906.)

Add exactly 25 c.c. of Fehling Solution A and 25 c.c. of Fehling Solution B (see under *Special Solutions and Reagents*) to 50 c.c. of reducing sugar solution (if a smaller volume of sugar solution is used, add sufficient water to make the final solution 100 c.c.); heat the solution at such a rate that boiling begins in four minutes and continue boiling for exactly 2 minutes, keeping the beaker covered with a watch glass; filter immediately on a Gooch crucible using suction; wash thoroughly with water at 60°C., then with 10 c.c. of alcohol and finally with 10 c.c. of ether; dry for 30 minutes in an oven at 100°C., cool in a desiccator and weigh as cuprous oxide.

(Expressed in Milligrams)

Cuprous Oxide Cu_2O	Dextrose $C_6H_{12}O_6$	Invert Sugar	Lactose $C_{12}H_{22}O_{11}$	Maltose $C_{12}H_{22}O_{11}$	Cuprous Oxide Cu_2O	Dextrose $C_6H_{12}O_6$	Invert Sugar	Lactose $C_{12}H_{22}O_{11}$	Maltose $C_{12}H_{22}O_{11}$

GRAVIMETRIC FACTORS AND THEIR LOGARITHMS

Computed from the International atomic weights of 1936* by Eric A. Arnold.

To facilitate the use of the table the group of substances weighed given under each element as well as the substances sought under each substance weighed are arranged in the alphabetical order of their formulae.

Weighed	Sought	Factor	Logarithm
Aluminum: Al = 26.97			−10

HEAT OF FORMATION AND SOLUTION

The following table gives the heat of formation of compounds from the elements in their standard states (18° C, 1 atm.) and the heat of solution in water in kilogram calories (mean) per gram-formula weight. To convert to B.T.U. multiply by 3.9685. To convert to kilojoules multiply by 4.186.

Values given are for 18° C and 1 atm. unless otherwise indicated. The heat of solution is given in most cases for a definite number of water molecules to one of the substance. Where this is not stated the dilution is understood to be such that additional dilution produces a negligible thermal effect.

The symbol ∞ indicates that the substance is formed in an "infinite" amount of water.

HEAT OF COMBUSTION

For Organic Compounds

The heat of combustion is given in kilogram calories per gram molecular weight of the substance when combustion takes place at atmospheric pressure and 20° C. The final products of combustion are gaseous carbon dioxide, liquid water and nitrogen gas for C, H, N compounds. For method of computing heats of formation see statement following this table.

Selections from a compilation by Kharasch, Bureau of Standards Journal of Research **2**, 359 (1929).

Name	Formula	Physical state	Heat of combustion, kg. calories
Acetaldehyde	CH_3CHO	liquid	279.0
Acetamide	CH_3CONH_2	solid	282.6
Acetanilide	$CH_3CONHC_6H_5$	solid	1,010.4
Acetic acid	CH_3CO_2H	liquid	209.4
Acetic anhydride	$(CH_3CO)_2O$	liquid	431.9
Acetone	$(CH_3)_2CO$	liquid	426.8
Acetonitrile	CH_3CN	liquid	302.4
Acetophenone	$C_6H_5COCH_3$	solid	988.9
Acetylacetone	$CH_3COCH_2COCH_3$	liquid	615.9
Acetylene	$(CH)_2$	gas	312.0

HEAT OF FORMATION

FOR ORGANIC COMPOUNDS

The heat of formation of a compound "A" is equal to the sum of the heats of formation of the products of combustion minus the heat of combustion (see preceding table) of the compound "A." The heat of formation of:

Free elements..................	0	kg-cal
CO_2 (gas)......................	94.38	"
$\frac{1}{2}H_2O$ (liquid from 1 H).........	34.19	"
HF (dilute aqueous solution).....	75.6	"
SO_2 (gas)......................	69.3	"
HBr (aqueous solution)..........	28.54	"
HCl (aqueous solution)..........	39.46	"
HNO_3 (aqueous solution)........	49.80	"
H_2SO_4 (aqueous solution)........	207.5	"

Example I

To calculate the heat of formation of methane (CH_4) where

Heat of combustion of methane = 210.8
Heat of formation of CO_2 = 94.38
Heat of formation of $\frac{1}{2}H_2O$ = 34.19

and where the combustion occurs according to the equation:

$$CH_4 + 2O_2 = CO_2 \text{ (gas)} + 2H_2O \text{ (liquid)}$$

Then the heat of formation of $CH_4 = 94.38 + 4(34.19) - 210.8 = +20.34$ kg-cal. per gram molecular weight.

Example II

To calculate the heat of formation of ethylene (C_2H_4) where

Heat of combustion of ethylene = 331.6

and the combustion occurs according to the equation:

$$C_2H_4 + 3O_2 = 2CO_2 + 2H_2O$$

The heat of formation of $C_2H_4 = 2(94.38) + 4(34.19) - 331.6 = -6.08$ kg-cal. per gram molecular weight.

Example III

To calculate the heat of formation of ethylamine ($C_2H_5NH_2$) where

Heat of combustion of ethylamine = 408.5

and the combustion occurs according to the equation:

$$C_2H_5NH_2 + 3.75O_2 = 2CO_2 + 3.5(H_2O) + N_2$$

The heat of formation of $C_2H_5NH_2 = 2(94.38) + 7(34.19) + O(N_2) - 408.5 = +19.59$ kg-cal. per gram molecular weight.

COMBUSTION CONSTANTS OF GASES

The flue products are based upon air with 21% oxygen and 79% nitrogen; flame temperatures are not corrected for dissociation; the high or gross heat value is one which would be obtained by burning in a Junker's calorimeter; it includes the heat of condensation of the water formed by combustion and assumes that all products of combustion are cooled to the initial temperature; the low or net heat value assumes that all of the products of combustion except water have been cooled to the initial temperature; the difference between the gross and the net is equal to the heat of vaporization of water at the initial temperature.

HEATS OF COMBUSTION AND COMPOSITION OF MANUFACTURED AND NATURAL GASES

Products of combustion, theoretical flame temperatures, air required and B.T.U. of gas-air mixture are based upon air with 21 % oxygen and 79 % nitrogen; heat values are calculated from the table as given under "Combustion Constants of Gases;" flame temperatures are not corrected for dissociation; carburetted water gas, coal gas, coke-oven gases and oil gas contain a small amount of benzene and oxygen.

	Combustion Values								Composition								
	Theoretical flame temp. ° F.	B.T.U per cu. ft., high (gross) 60° F., 30 in. Hg, satd H_2O	B.T.U. per cu. ft., low (net) 60° F., 30 in. Hg, satd. H_2O	Cu. ft. air required per cu. ft. gas	Cu. ft. HEAT OF COMBUSTION, VARIOUS SUBSTANCES

Approximate values of heat of combustion in kilogram calories per gram of substance. Products of combustion are gaseous unless otherwise stated.

Substance	Kg-cal. per gram of substance	Observer
Asphalt	9.530	Slossen, Colburn
Bagasse (refuse from sugar cane), 12% H_2O	4.045	Aufhäuser—1931, 1935
Bamboo, 10.5% H_2O	4.110	
Buckwheat hulls, 10% H_2O	4.219	Aufhäuser—1931, 1935
Butter	9.200	
Carbon:		
amorphous	8.080	Mean
charcoal	8.100	Mean
diamond	7.860	Berthelot
graphite	7.900	Berthelot
Casein	5.860	
Charcoal, 4% H_2O	7.260	
Coconut shells, 13% H_2O	4.200	Freise—1932
Copper (to CuO)	.590	Thomsen
Dynamite, 75%	1.290	Roux, Sarran
Egg white	5.700	
Egg yolk	8.100	
Fats, animal, mean	9.500	
Gunpowder	0.720–0.750	
Hemoglobin	5.900	
Hydrogen, to liquid	33.900	Mean
Hydrogen, to gas	29.150	Berthelot
Iron (to Fe_2O_3)	1.582	
Leather, cuttings 13.7% H_2O	4.729	Aufhäuser
Magnesium (to MgO)	6.080	
Nitrocellulose, 11.29% N.	2.576	Ball—1931
Oak bark, 7% H_2O	4.522	Fieldner
Oil:		
cotton seed	9.500	
lard	9.300	Mean
linseed	9.434	Caldwell, Mattiello—1932
olive	9.400	Mean
paraffin	9.800	Mohler
petroleum:		
crude	11.500	Mean
heavy	10.200	Mean
light	10.000	Mean
rape	9.500	Stohmann
sperm	10.000	Gibson
Paraffin (to CO_2, H_2O l)	11.140	Stohmann
Paraffin (to CO_2, H_2O g)	10.340	Stohmann
Pitch	8.400	
Rubber	3.349	Aufhäuser
Sulfur:		
monoclinic	2.240	Thomsen
rhombic	2.200	Mean
Tallow	9.500	Stohmann
Woods:		
beech, 13% H_2O	4.170	Gottlieb
birch, 12% H_2O	4.210	Gottlieb
oak, 13% H_2O	3.990	Gottlieb
pine, 12% H_2O	4.420	Gottlieb

FREE ENERGY

The free energy change of a chemical reaction is the sum of the free energies of formation from their elements of the products of the reaction less the free energy of formation of the reacting substances.

The free energy values $\Delta F°$ given in the following table refer to the energy of formation from the elements in their standard states at 25° C. The free energy of all elements in their standard states and of H^+ is taken as zero.

Values are in kilogram calories per mole at 25 °C.

Substance	$\Delta F°$ kg cal.	Substance	$\Delta F°$ kg cal.

CHARACTERISTICS AND FUNCTIONS OF THE VITAMINS

Compiled by H. J. Prebluda

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin A............ (animal sources) **Carotenes** (plant sources) (provitamin A) Fat soluble A Anti-Xerophthalmic vitamin	*Vitamin A_1* ($C_{20}H_{29}OH$) *Vitamin A_2* ($C_{22}H_{31}OH$) Pale, viscous, fat-soluble, heat and oxygen labile liquids found in fish liver oils. *Carotenes*—orange red pigments—Kryptoxanthin, alpha and beta carotene—found in plants and are precursors of vitamin A being changed to this vitamin in the human body. Have same fat soluble and labile properties of vitamin A especially to oxidation. One molecule of beta carotene has physiological potency of two molecules of vitamin A. Alpha carotene has 50% activity of beta carotene.	Vitamin A is essential for growth, normal vision and for maintenance of normal condition of epithelial tissue. Prevention of nyctalopia (night blindness) and regeneration of retinal visual purple bleached by light. Dried out epithelial tissue deficient in vitamin A seems to have less resistance to invasion by bacteria. Requirements are greatest during periods of rapid growth, pregnancy, lactation or illness.	Dryness and keratinization of the eye conjuctiva (xerophthalmia) hyperkeratosis of mucous membrane and dermal structures. Dryness of skin. Retardation of growth.	Leafy portions of green plants Salt water fish liver oils—A_1 Fresh water fish liver oils—A_2 Eggs Butter Cream Provitamin A found in pigmented plants such as carrots, sweet potatoes, yellow corn, etc. Apricots
Vitamin B_1.......... Thiamin chloride Thiamin hydrochloride Aneurin Anti-beri-beri vitamin Anti-neuritic vitamin	A white crystalline powder having the formula $C_{12}H_{17}ON_4SCl.HCl$, soluble in alcohol and water. Heat and alkali labile stable to aeration.	Necessary in formation of enzymes participating in carbohydrate metabolism. Essential for maintenance of good appetite, normal	Retarded growth, loss of appetite, leg weakness, convulsive seizures associated with spastic paralysis and focal accumulation	Liver Yeast Milk Eggs Fruits Legumes

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
	Molecular structure includes a pyridine and thiazole group which is broken down by sulfite treatment.	digestion and gastric tonicity. Necessary for lactation and reproduction. Lack of vitamin B_1 has been responsible for various forms of nerve disturbances and suboptimal growth of infants and children.	of pyruvic acid in central nervous systems with accompanying polyneuritis. Emotional instability and enlargement of heart.	Leafy vegetables Lean meat Embryos of cereal grains
Vitamin B_2.. (Member of the vitamin B Complex) Riboflavin Vitamin G Lactoflavin (from milk) Ovoflavin (from eggs) Hepatoflavin (from liver)	An orange yellow pigment ($C_{17}H_{20}N_4O_6$) containing an iso-alloxazine nucleus combined with *d*-ribose. Solutions of riboflavin exhibit a strong greenish-yellow fluorescence in ultra violet which is the basis for fluorometric assay of this vitamin. Riboflavin is water soluble, heat stable in acid or neutral solutions and readily destroyed in an alkaline medium. Visible light (blue and violet regions) destroys this vitamin.	Necessary for growth and respiration of all tissues and cells. Has been demonstrated to increase vitality and postpone senility in succeeding generations of experimental animals. Necessary for growth of domestic animals. Necessary for egg hatchability.	A reddening and slimy denuded appearance of the lips, waxy accumulations at the nasolabial folds of the skin, ocular lesions accompanied by burning sensation and light sensitivity, roughening of skin around the mouth and across tip of nose. Curled toe paralysis in chicks.	Milk Liver Eggs Wheat germ Fermentation by-products Meat Leafy vegetables
Niacin....... Nicotinic acid Pellagra preventive P-P factor	3-pyridine carboxylic acid which is somewhat soluble in hot water. The amide derivative is	A component of co-enzymes important in glycolysis and cellular respiration.	Pellagra with burning soreness of mouth, loss of appetite, loss of weight, and diges-	Liver Kidney Lean meat Peanuts

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Anti-black tongue factor (Member of vitamin B complex)	more soluble and called niacinamide. Relatively stable to heat.	Essential for health and growth. Necessary for maintaining normal function of skin and gastro-intestinal tract.	tive nervous disturbances.	Yeast Eggs Fish Bran Green leafy vegetables
Vitamin B_6............ (Member of vitamin B complex) Pyridoxin Adermin Rat acrodynia factor	Derivative of pyridine. Commercially available as hydrochloride—white powder ($C_8H_{11}NO_3.HCl$) which is stable in solution in absence of strong light. Acid solutions stable to autoclaving below pH5.	Significance in human nutrition not fully established. Has been found useful in alleviating certain nervous and muscular disorders. Probably plays role in unsaturated fatty acid utilization and liver metabolism. Important in chick, hog, and dog nutrition.	Microcytic hypochromic anemia in dogs, lack of coordination of gait of pigs. One of the vitamins lacking in individuals having multiple deficiencies in pellagra.	Liver Yeast Crude cane molasses Cereals Legumes Milk
Pantothenic Acid...... Pantothen Filtrate factor Chick anti-dermatitis factor Factor II (Member of vitamin B complex)	Beta-alanine derivative of a substituted butyryl lactone. A white solid not readily soluble in water. Commercially available as calcium salt $Ca(C_9H_{16}O_5N)_2$ which is water soluble. Stable to autoclaving, light oxidizing and reducing agents. Unstable to alkali.	Significance in human nutrition not established. Essential for certain bacteria, rats, chickens, and dogs, as well as humans Necessary for maintaining normal adrenal activity. Thought to be one of several substances playing a role in preventing grey hair. Essential for growth and reproduction of chicks.	Dermatitis in chicks. Retarded growth and greying of hair in rats. Deficiency usually occurs along with pellagra	Yeast Liver Kidney Eggs Cane Molasses Milk Wheat germ

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Choline (Member of vitamin B complex)	Hydroxyethyl trimethyl ammonium hydroxide—a colorless viscous liquid which has strong basic properties. Basic constituent of lecithin and the chloride is available commercially. The latter is a colorless crystalline hygroscopic solid—very soluble in water. Salty, bitter taste.	Essential in fat metabolism to mobilize fatty acids, supplies "labile" methyl groups.	Impairment of liver and renal functions. "Slipped tendon" of fowl.	Liver Egg yolk Brain Kidney Heart Sweet breads Yeast Cereal germs Legumes Green leafy vegetables Potatoes Milk
Vitamin C Ascorbic acid Anti-scorbutic vitamins Cevitamic acid	A hexuronic acid. A white crystalline solid soluble in water with sour acid taste. Insoluble in oils. Destroyed by exposure to air, light, and alkali. Deterioration accelerated by metals such as iron and copper. Strong reducing agent. Cannot be stored in the body.	Prevents and cures scurvy. Necessary for formation and maintenance of intercellular tooth and bone structure. Prevents capillary fragility. Increases resistance to bacterial toxins and infections. Infection increases vitamin C requirement of body.	Scurvy. Dental caries. Gum infections. Slow healing of wounds. Defective formation of bones and teeth.	Citrus fruits Alfalfa Cabbage Green and red peppers Raw turnip Tomato Pineapple
Vitamin D Anti-rachitic vitamin	At least ten active vitamin D sterols are known. The two important sterols are vitamin D_2 (activated ergosterol, calciferol) derived mainly from vegetable sources and vitamin	Regulation of calcification of bone structure Regulates absorption and utilization of calcium and phosphorous.	Rickets. Poor bone development. Tooth decay. Osteomalacia.	Fish liver oils Mackerel Herring Sardines Egg yolk Tuna Liver

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
	D_3 (activated 7-dihydrocholesterol) derived mainly from animal sources. Vitamin D is fat soluble, heat stable and not readily destroyed by oxidation. Can be produced in many foodstuffs by irradiation or exposure to sunlight. Light energy activates sterils present to active vitamin D. In similar fashion sterols beneath skin are activated to form vitamin D upon exposure to ultra violet or sunlight. Activated ergosterol dissolved in vegetable oils = viosterol.			
Vitamin E . . . . . Alpha tocopherol Anti-sterility vitamin	Has chromane structure ($C_{20}H_{50}O_2$). Thick viscous oil-soluble in fat solvents. Heat stable and resistant to mild oxidation. Ferric salts and rancid fats destroy physiological activity. Obtained from natural sources in unsaponifiable fraction.	Has anti-oxidant properties. Has not been demonstrated to be effective in humans but has been shown to prevent sterility in male and female rats. Important in muscular and nervous systems.	No definite deficiency symptoms in humans. Has been used with success in habitual and threatened abortion as well as certain neuromuscular disorders.	Wheat germ oil Corn oil Lettuce Spinach Egg yolk Meat Legume Seeds

*

Characteristics and Functions of the Vitamins (Continued)

Factor and synonyms	Description and properties	Importance	Deficiency symptoms	Chief natural sources
Vitamin K............ Anti-hemorrhagic factor Coagulation vitamin	Natural product is naphthoquinone compound—oily liquid and insoluble in H_2O. Fat-soluble, stable to heat and reducing agents. Labile to alcoholic alkali, oxidizing agents, strong acids, and $AlCl_3$. Occurs in nature as a phytyl derivative (vitamin K_1) in green leaves. The difarnesyl derivative (vitamin K_2) is formed by putrefaction. A commercial synthetic 2, methyl 1,4 naphthoquinone has vitamin K activity and is called Menadione.	Aids in prevention of hemorrhage in newborn. Essential in promoting normal prothrombin content and clotting of blood.	Obstructive jaundice. Hemorrhagic tendency. Poor healing of wounds after post-operative conditions.	Alfalfa concentrate Spinach Cabbage Cauliflower Kale Carrot greens Tomatoes

Vitamin Unit Table

Vitamin A	1 International Unit = 1 USP Unit Activity of 0.6 micrograms* of beta-carotene
Vitamin B_1	1 International Unit = 1 USP Unit Activity of 3 0 micrograms of crystalline thiamin chloride
Riboflavin	Quantities expressed in micrograms or milligrams
Niacin Niacin amide	Quantities expressed in micrograms or milligrams
Pantothenic acid	Quantities expressed in micrograms or milligrams
Choline	Quantities expressed in milligrams
Pyridoxine	Quantities expressed in micrograms or milligrams
Vitamin C	Expressed in milligrams 1 International Unit = 1 USP Unit and is equal to activity of 0.05 milligrams of synthetic ascorbic acid.
Vitamin D (For humans and four-footed animals)	1 International Unit = 1 USP Unit Potency of 0 025 micrograms of pure Vitamin D_2 (calciferol) made by irradiation of ergosterol.
Vitamin E	Measured in micrograms or milligrams One I.U is the alpha tocopherol activity of 0.1 gm of the International standard solution containing 1 mg. of pure synthetic alpha tocopherol acetate.

* Note.—One microgram = 0.000001 grams.

Abbreviations

A = Vitamin A
B = Vitamin B_1
C = Vitamin C
D = Vitamin D
E = Vitamin E
K = Vitamin K
N = Nicotinic Acid or Niacin
R = Riboflavin

Reaction indicates the type and degree of reaction of the food in the body. The relative acidity or basicity is indicated by the designation h, high, m, medium; and l, low

Recommended Dietary Allowances[1] (Continued)

[1] Revised 1945 Food and Nutrition Board, National Research Council.

[2] The allowance depends on the relative amounts of vitamin A and carotene. The allowances of the table are based on the premise that approximately two-thirds of the vitamin A value of the average diet in this country is contributed by carotene and that carotene has half or less than half the value of vitamin A.

[3] For adults (except pregnant and lactating women) receiving diets supplying 2,000 calories or less, such as reducing diets, the allowances of thiamin, riboflavin, and niacin may be 1 mg., 1.5 mg., and 10 mg. respectively. The fact that figures are given for different calorie levels for thiamin, riboflavin, and niacin does not imply that we can estimate the requirement of these factors within 500 calories, but they are added merely for simplicity of calculation. Other members of the B complex also are required, though no values can be given. Foods supplying adequate thiamin, riboflavin, and niacin will tend to supply sufficient of the remaining B vitamins.

[4] There is evidence that the male adult needs little or no iron. The allowance will be provided if the diet is satisfactory in other respects.

[5] For persons who have no opportunity for exposure to clear sunshine and for elderly persons, the ingestion of small amounts of vitamin D may be desirable. Other adults probably have little need for vitamin D.

[6] During the latter part of pregnancy the allowance should increase approximately 20 percent over the preceding level. The value of 2500 calories represents the allowance for pregnant, sedentary women.

[7] Allowances for children are based on the needs for the middle year in each group (as 2, 5, 8, etc.) and are for moderate activity and for average weight at the middle year of the age group

[8] Needs of infants increase from month to month with size and activity The amounts given are for approximately 6 to 8 months. The allowance in calories and the protein in grams are indicated per kilogram weight. The values should be divided by 2.2 to obtain the figures per pound weight. The dietary requirements for some of the nutrients such as protein and calcium are less if derived largely from human milk.

COMPOSITION AND VALUE OF FOODS

Compiled mainly from the publications of the U. S. Department of Agriculture.

The proportions of **protein, fat, carbohydrate** and **mineral matter** are given as percent by weight of the food named. The fuel value is stated in kilogram calories per 100 grams.

The standard daily requirement for an average adult has been accepted as 3000 calories; 75 g of protein, 0.69 g of calcium, 1.32 g of phosphorus, 0.015 g of iron.

The relative value of the food as a source of **vitamins** is shown by letters indicating the vitamins present with subscripts showing the relative abundance. Symbol **N** is used to indicate nicotinic acid and **R**, riboflavin. The best sources are indicated as rich in the particular vitamin by the subscript r. Other classifications are shown by the subscripts e, g and f for excellent, good and fair respectively.

$CaSO_4$	1200	...	CaO	White
$BaSO_4$	1510	...	BaO	White

SPECIFIC GRAVITY OF AQUEOUS SOLUTIONS

The following collections of tables gives the specific gravity, grams per liter, pounds per cubic foot, and pounds per gallon for a large number of substances in aqueous solution. The three latter quantities have been computed from the per cent of the substance in solution and the specific gravity, assuming the density of water at 4° C. as unity. The U. S. gallon, cubic foot, and pound avoirdupois equivalents were used. The degree Baumé corresponding to the specific gravity is given according to the relation,

$$\text{Bé.} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

The per cent by weight is indicated in every case.

The substances are arranged in alphabetical order. The specific gravity of alcohol solutions will be found in a separate group. Another table gives, with less detail, the specific gravity of solutions of many other substances.

Tables indicated by the symbol * have been computed on the basis of values for the specific gravity found in the International Critical Tables.

AQUA AMMONIA

Authority — W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = \frac{140}{\text{Sp. Gr.}} - 130.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

The coefficient of expansion for Ammonia Solutions varying with the temperature, correction must be applied according to the following table:

Corrections to be added for each degree below 60° F.			Corrections to be subtracted for each degree above 60° F.			
Degrees Baumé	40° F.	50° F.	70° F.	80° F.	90° F.	100° F.

HYDROCHLORIC ACID

Authority — W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}$$

Baumé Hydrometers for use with this table must be graduated by the above formula which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

10° – 15° Bé. — 1/40° Bé. or .0002 Sp. Gr. for 1° F.
15° – 22° Bé. — 1/30° Bé. or .0003 " " " 1° F.
22° – 25° Bé. — 1/28° Bé. or .00035 " " " 1° F.

NITRIC ACID

Authority — W. C. Ferguson

This table has been approved and adopted as a Standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

At 10°–20° Bé. — 1/30° Bé. or .00029 Sp. Gr. = 1° F.
20°–30° Bé. — 1/23° Bé. or .00044 " " = 1° F.
30°–40° Bé. — 1/20° Bé. or .00060 " " = 1° F.
40°–48.5° Bé. — 1/17° Bé. or .00084 " " = 1° F.

TABLES OF THE MANUFACTURING CHEMISTS' ASSOCIATION

SULFURIC ACID

Authorities — W. C. FERGUSON; H. P. TALBOT

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should always be printed on the scale.

66° Baumé = Sp. Gr. 1.8354.

1 cu. ft. water at 60° F. weighs 62.37 lbs. av.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

H_2SO_4 = 100 per cent.

	H_2SO_4	O. V.	60°
O. V.	93.19	100.00	119.98
60°	77.67	83.35	100.00
50°	62.18	66.72	80.06

Acids stronger than 66° Bé. should have their percentage compositions determined by chemical analysis.

Bé.°	Sp. gr	Tw.°	Per cent H_2SO	Weight of 1 cu. ft. in lbs. av	Per cent O. V.	Pounds O. V. in 1 cu. ft.	* Freezing (melting) point.

ETHYL ALCOHOL

Specific Gravity of Mixtures of Ethyl Alcohol and Water by Volume and by Weight

Giving the specific gravity at 15.56° C. referred to water at the same temperature. To reduce to specific gravity referred to water at 4° C. multiply by 0.99908.

(U. S. Department of Agriculture.)

Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.	Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.

* For specific gravity of mixtures by weight see following table.

ETHYL ALCOHOL

Specific Gravity of Mixtures of Ethyl Alcohol and Water by Weight

The table gives the specific gravity at the temperature indicated referred to water at 4° C.

(U. S. Bureau of Standards.)

Per cent alcohol by weight.	15° C.	20° C.	25° C.	Per cent alcohol by weight.	15° C.	20° C.	25° C.

Calculation of the percentage of ethyl and methyl alcohols in a mixture with water, assuming a distillate to have a sp. gr of 0.97917 $\frac{15.56°}{15.56°}$ and a refraction of 30.0 at 20° on the immersion refractometer. — From the tables of sp. gr for these alcohols the density is found to correspond to 13.70% and 12.83% by weight of ethyl and methyl alcohol respectively; from the table above, the refractometer readings corresponding to 13.70% ethyl and methyl alcohol are 38.16 and 22.42 respectively. Then $(38.16 - 30.0) / (38.16 - 22.42) \times 100 = 51.8\%$, or 51.8% of the alcohol in the distillate is methyl alcohol.

$(12.83 \times 0.518) + 13.70 \times (1 - 0.518) = 13.25$ which is the % by weight of the mixed alcohols in the distillate, of which 13.25×0.518 or 6.86% is methyl alcohol and $13.25 \times (1 - 0.518)$ or 6.39% is ethyl alcohol.

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.

In the case of substances with voids such as paper or leather the bulk density is indicated rather than the density of the solid portion.

(Selected principally from the Smithsonian Tables.)

Substance	Grams per cu. cm	Pounds per cu. ft.	Substance	Grams per cu. cm	Pounds per cu. ft.

Physical Constants of Inorganic and Metal-Organic Compounds

Physical Constants of Organic Compounds

Constants of Vegetable and Animal Oils, Fats and Waxes

Physical and Chemical Constants of Resins, Oleo-Resins and Gum-Resins

Physical Constants of Minerals

Composition and Physical Properties of Alloys

Properties of Commercial Plastics

Physical Properties of Common Woods

DENSITY OF WATER

The temperature of maximum density for pure water, **free** from air = **3.98**°C.

The density at this temperature = **0.999973** g/cm³.

The density of water at 3.98° C is 1.000000 g/ml.

(International Bureau of Weights and Measures, 1910.)

DENSITY OF VARIOUS LIQUIDS

(Selected from Smithsonian Tables.)

Liquid	Grams per cu. cm	Pounds per cu. ft.	Temp. °C

HYDROMETERS AND DENSITY UNITS

Alcoholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent.

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barktrometer or *Barkometer.* — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

$$\text{Sp. gr.} = \frac{m}{m - d} \quad \text{where } \begin{array}{l} m = 145 \text{ (in the United States)} \\ m = 144 \text{ (old scale used in Holland)} \\ m = 146.78 \text{ (New scale or Gerlach scale)} \\ d = \text{Baumé reading} \end{array}$$

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or *Balling Saccharometer* shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer.—For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

RELATIVE DENSITY AND VOLUME OF WATER

The mass of one cubic centimeter of water at 4° C is taken as unity. The values given are numerically equal to the absolute density in grams per milliliter.

(Smithsonian Tables, compiled from Various Authors.)

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D, the density at absolute temperature T and pressure P.

The density of **moist** air may be determined by a similar relation:

$D = 1.2929\ (273.13/T)\ [(B - 0.3783e)/760]$ where T is the absolute temperature; B, the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The **first factor,** $1.2929\ (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The **second factor,** $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l.

To facilitate obtaining **approximate values** of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833 \text{ g/l.}$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

$(1.2929 \times 273.13/T)$

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B - 0.3783e$) The latter may be obtained by use of Table II.

°C	600	610	620	630	640	650	660	670	680	690

ELASTIC CONSTANTS FOR SOLIDS

The following table gives values for the yield point (or elastic limit, indicated by e), ultimate tensile strength Young's modulus and the modulus of rigidity in kg/mm². The Brinell hardness number is also given, representing the ratio of load in kilograms on a sphere used to indent material to the spherical area of the indentation in square millimeters.

YIELD POINT, TENSILE STRENGTH, BRINELL HARDNESS

Material	Yield point Kg/mm²	Yield point Lbs./in.²	Ultimate tensile strength Kg/mm²	Ultimate tensile strength Lbs./in.²	Brinell hardness number
		×10³		×10³

ELASTIC CONSTANTS FOR GASES

For short ranges of pressure, at a constant temperature, the volume of a gas is inversely proportional to the pressure or pressure × volume = a constant. (Boyle's Law.)

For high pressures, the table below shows the relative volumes at various temperatures. The volume at 0° C. and 76 cm. pressure (1 atmosphere) being taken as 1,000,000.

(From Smithsonian Tables.)

SURFACE TENSION

Compiled by T. Fraser Young and William D. Harkins

Meaning of Symbols

γ = the surface tension in dynes per centimeter.

$\Delta\gamma$ = the surface tension of a solution minus the surface tension of the pure solvent.

-- air, means that the liquid was in contact with air (saturated with its own vapor).

-- vapor, means that the liquid was in contact with its own vapor.

-- N_2 and -- H_2 have corresponding meanings.

-- also designates the surface between a pair of liquids at which the interfacial tension was determined.

% = weight % of the solute (i. e. the organic substance).

f = gram formula weights per 1000 grams of solvent (i. e. water).

°C = degrees Centigrade.

°K = degrees Kelvin or Absolute. Temperature in °C = Temperature in °K − 273.1.

M.P., at the melting point.

k_E = the Eötvös Constant, in erg mole$^{-\frac{2}{3}}$ degree^{-1}.

$$-k_E = \frac{d\,\Gamma}{d\,t} = \frac{d\,(M/d)^{\frac{2}{3}}\,\gamma}{d\,t}$$

where $\Gamma = \gamma\,(M/d)^{\frac{2}{3}}$

M = mass of one gram formula weight of the substance

d = density of the substance.

AQUEOUS SOLUTIONS AGAINST AIR

INORGANIC

(f = gram formula weights per 1000 grams of solvent.)

For the following aqueous solutions the values of $\Delta\gamma$ are given. $\Delta\gamma$ is the difference between the surface tension of the solution and that of the solvent at the same temperature. Positive values of $\Delta\gamma$ mean that the surface tension of the solution is greater than that of the solvent. Negative values, the reverse. For convenience in computing the surface tension, the current accepted value for the surface tension of water at the stated temperature is given in the second column.

Formula	°C (γH_2O)		$\Delta\gamma$ for concentrations indicated

VISCOSITY

The **viscosity** of a substance is defined as the tangential force per unit area of either of two horizontal planes at unit distance apart, one of which is fixed, while the other moves with unit velocity, the space being filled with the substance.

In the case of a liquid flowing slowly through a long tube of small diameter, the volume V of liquid which escapes in a time t is given by the equation,

$$V = \frac{\pi p r^4}{8 l \eta} t$$

where p is the difference in pressure between the two ends of the tube; r, its radius; l, its length, and η, the viscosity. (Law of Poiseuille.)

A more complete equation is now generally used:

$$\eta = \frac{\pi d g r^4 t}{8Q(l + \lambda)}\left(h - \frac{mv^2}{g}\right)$$

where η is the viscosity; d, the density in g/cm³; r, the radius, and l, the length, of the tube in cm; Q, the volume in cm³ discharged in t sec.; λ, a correction to the length of the tube; h, the average head in cm; m, the coefficient of the kinetic energy correction, mv^2/g; g, the acceleration due to gravity in cm/sec.²; v, the mean velocity in cm/sec. See Technologic Papers of the Bureau of Standards 100 and 112, 1917 and 1918, for a full discussion

Viscosity is expressed in dyne-seconds per cm² or poises. The centipoise (cp) is 0.01 poise.

Specific viscosity is the ratio of the viscosity of any substance to that of water at 0° C or other specified temperature. Since the viscosity of water at 20° C is 1.0050 centipoises, the viscosity of any substance expressed in centipoises is approximately equal to its specific viscosity referred to water at 20° C.

Kinematic viscosity is the ratio of the viscosity to the density

Fluidity is the reciprocal of viscosity.

VISCOSITY OF WATER BELOW 0° C

White-Twining, 1914

THERMAL EXPANSION OF GLASSES

The following table gives the mean coefficient of linear expansion for various types of glass as determined by Peters and Cragoe of the Bureau of Standards. 1920.

Glass sample	Temp. interval	Coefficient	Temp. interval	Coefficient
		$\times 10^{-4}$		$\times 10^{-4}$
1 Barium flint	22–494	0.088	519–550	0.331
4 Plate, American	20–508	.108	540–560	.401
6 German	21–496	.099	564–589	.477
7 French	21–513	.094	597–613	.424
8 Light crown	24–422	.104	494–507	.548
10 Borosilicate crown	22–498	090	539–562	.393
11 Barium crown	23–499	.090	589–610	.649
12 Medium flint	23–402	.097	452–478	.396
13 Light flint	22–451	.088	494–512	.347
16 Commercial glass	23–445	.107	510–534	.309
20 McBeth-Evans flask	22–449	.069	567–586	.454
21 Pyrex	21–471	036	552–571	.151
22 Schott-Genossen flask	19–414	.056	540–562	.404
23 Soda tubing	21–372	.120	506–525	.234
24 Lead tubing	21–338	.091	464–483	.236
26 Fluorite tubing	22–364	.098	510–551	284
29 Fusing in glass, German	23–383	090	456–481	.283
30 Fusing in glass, Corning	22–376	083	460–485	258
Chemical glassware*				
Glasbake	20–300	.037		
Kimble	20–300	.049		
Pyrex	20–300	.033		
Vycor	20–300	.008		

More complete data, including the composition of the samples named above, will be found in Scientific Paper No. 393, Bureau of Standards.

EQUATION FOR THE LINEAR EXPANSION OF SOLIDS

If l_0 is the length at 0° C the length at t° C is $l_t = l_0\ (1 + \alpha t + \beta t^2)$.
The table gives the values of these coefficients.

Substance	Temp limits °C	α	β	Observer
Aluminum	10–90	$.2221 \times 10^{-4}$	114×10^{-7}	Fizeau
Brass	10–90	1781	.098	Fizeau
Copper	10–90	1596	102	Fizeau
Gold	10–90	1410	042	Fizeau
Iron, pure	0–38	1145	.071	Guillaume
Lead	10–90	2829	.120	Fizeau
Nickel	0–38	1255	057	Guillaume
Platinum	0–1000	0868	.013	Holborn and Valentine
Silver	10–90	1862	.074	Fizeau
Tin	10–90	.2094	.175	Fizeau
Zinc	10–90	2969	− 0635	Fizeau

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion for a solid is approximately three times the linear coefficient.

The experimental values for various solids are given in the following table. The coefficient is the increase in volume per unit volume per degree Centigrade.

Substance	Temp °C	Coefficient	Observer
Antimony	0–100	0.3167×10^{-4}	Matthiessen
Asphalt	...	5–7	...
Beryl	0–100	0.3167	Pfaff

REDUCTION OF GAS VOLUME TO NORMAL CONDITIONS

Factors and their logarithms for reducing a gas volume to normal conditions, 0° C., 760 mm pressure.

The volume of *dry* gas measured at any temperature 10–35° C. inclusive and pressure 690–784 mm of Hg may be reduced to the volume at 0° C. (273.18° K.) and 760 mm of Hg pressure by multiplying by the factor found in the table.

In case the volume of gas is measured in the presence of water vapor the pressure of the aqueous vapor must be subtracted from the value of the total or barometric pressure before entering the table. In the case of atmospheric air the vapor pressure may be found by determining the dew point or temperature of saturation. The pressure of water vapor may then be read from the small table below. If gas volumes are measured over water, the vapor pressure will be that of saturated aqueous vapor at the temperature used. A table giving the pressure of saturated aqueous vapor over water is given below.

Pressure of Saturated Water Vapor

Heat Capacity of Air-free Water 0°-100°C at 1 Atmosphere Pressure

The heat capacity of air-free water is given in international steam table calories per gram and in absolute joules per gram. (1 absolute joule—0.238846 I.T. Cal.).

The enthalpy or heat content is given for air-free water in I.T. Cal. per gram and in absolute joules per gram.

From Osborne, Stimson and Ginnings, B of S. Jour. Res **23**. 238, 1939.

SPECIFIC HEAT OF WATER (Continued)

Specific Heat of Water Above 100°C

Mean specific heat of water in 15°C calories between 0°C and the temperature stated.

Heat content (Enthalpy) in joules per gram between 0°C and the temperature stated.

From data by Osborne, Stimson and Fiock, B of S Jour. Res. 5, 411, 1930.

SPECIFIC HEAT AND ATOMIC HEAT OF MERCURY

The specific heat is given in relation to water at 15°C. The atomic heat is the thermal capacity of one gram atom.

Values between −75.6° and −36.7°C. are from Carpenter and Stoodley, Phil. Mag. **10**, 249. 1930; from 0 80°C., Barnes-Cooke, from 90 140°C., mean of Winklemann, Naccari and Milthaler, above 140°C., mean of Naccari and Milthaler.

Temp. °C	Specific heat	Atomic heat	Temp. °C	Specific heat	Atomic heat

SPECIFIC HEAT OF LIQUID ORGANIC COMPOUNDS

Specific heat is given in calories (15°) per gram per degree Centigrade. To change to joules per gram per degree Centigrade multiply by 4.185.

Name	Formula	Temperature, °C.	Specific Heat Cal. 15°/g/°C

COLOR SCALE OF TEMPERATURE

This table is the result of an effort to interpret in terms of thermometric readings, the common expressions used in describing temperatures. It is obvious that the values are only approximations.

Color.	Temperature, °C.
Incipient red heat	500–550
Dark red heat	650–750
Bright red heat	850–950
Yellowish red heat	1050–1150
Incipient white heat	1250–1350
White heat	1450–1550

SPECIFIC HEAT

Variation with Temperature

The table gives the true specific heat at the temperatures named. From data of Wüst, Meuthen, and Durrer, 1918.

°C	Pb	Zn	Al	Ag	Au	Cu	Ni	Fe	Co	Quartz
